Description

As you might be able to tell, most of this writeup was written before the founder made an offer just before I was going to post this. However, while the offer was made, I still think it is an interesting idea. I've included much of the original writeup below, with the 4th thesis being an update after the recent letter. The situation is very fluid and subject to change as the it progresses.

Executive Summary:
Seer is a busted proteomics company trading at ~$1.60 compared to closer to $2.45 in net cash by YE26. After numerous acquisitions offers, activists Bradley Radoff and Michael Torok (JEC) are contesting Seer's July 28 AGM with 3 competing board nominees to replace an entrenched board that has seen the stock drop nearly 90% in an attempt to return cash back to shareholder. Management is defending a standalone plan that does not reach breakeven until 2031, with the market pricing an inevitable burn of cash. However, if the Radoff-JEC group can gain control of the board, they can force the company to return capital back to shareholder, with upside optionality with the sale of the Proteograph platform to a strategic. I recommend buying Seer at nearly ~55% of net cash while voting for the Radoff-JEC group w/ the WHITE card.

Company Background:
Seer (NASDAQ: SEER) is a proteomics company that sells the Proteograph Product Suite, a nanoparticle-based platform for deep, unbiased plasma proteomics that they co-market with Thermo Fischer. At ~$1.60, the company has roughly a $90m MC against $220m of cash and investments, representing an EV of -$130m.

Industry Overview:
Proteomics is the large-scale study of proteins, which provide a more dynamic view of biological functions and diseases than the information contained in the genome. The market includes affinity-based and mass-spectrometry-based workflows, with Seer operating in the sample preparation and data analysis layer. While adoption has remained constrained by the expensive instrumentation and long customer-validation cycles, long-term demand should be supported by gradual pharmaceutical biomarker discovery, population-scale studies, and AI-driven biology.

Market View:
The market is discounting Seer's cash because the Proteograph business remains commercially unproven, management is expected to keep funding losses, and the belief that the activist campaign will ultimately fail to force a capital return.
[1] Despite years of R&D spending and the launch of the upgraded Proteograph products, Seer has generated minimal commercial growth. Q1 26 revenues declined nearly 35%, while full year guidance only implies 3% growth at the midpoint. As such, the market assumes that scientific validation will not translate to meaningful commercial results and will continue to have negative cash burn.
[2] As a result of the continued negative cash burn, the company still remains years away from profitability. If continuing operations, the market believes that Seer will continue to waste away the current cash balance on a commercially inviable product at the expense of shareholders
[3] Despite the situation, the entrenched board appears committed to the standalone strategy. The board attempted (and failed) to extend the sunset of Class B super-voting shares, adopted a low-threshold poison pill, rejected repeated acquisition and tender proposals from Radoff and JEC, and continues to argue that Seer's platform has long-term value despite historical results. The market believes that this board is entrenched and will continue to prioritize personal control at the expense of shareholder value
[4] Relatedly, it remains uncertain if the Radoff-JEC group can secure sufficient support for their 3 candidates from Seer's major shareholders. The voting intentions of the SoftBank, aMoon, Invus, and other institutional shareholders remain uncertain, while the activists' willingness to settle the contest in exchange for a 20m share tender at $2.50 could suggest their own uncertainty at winning.

If the incumbent slate prevails and the Radoff-JEC is unable to make process in both the acquisition or AGM, the clearest path to a capital return in the short-term disappears and the stock will likely remain at a significant discount to cash.

Investment Theses:
[1] Seer trades at a steep discount to cash, with Proteograph and NOLs providing additional upside to a strategic acquirer

a) The cash discount remains extremely wide even after accounting for burn and liabilities
Before even getting to the proxy contest, I think the important starting point is that Seer is already cheap on the balance sheet alone. At ~$1.63, the company trades at roughly 65% of a conservative estimate of YE26 net cash of ~$2.45/share after deducting the expected remaining burn for 2026, all reported liabilities, and using a fully diluted share count. In the base case, I assign 0 value to Seer's Proteograph or any of the NOLs that they have, both of which could provide value to any strategic acquirer.

SEER	
Current Share Price	**$1.63**
(x) Shares Outstanding	61

YE26 Net Cash	**148.9**
YE26 Net Cash per Share	**$2.44**
% Upside / (Downside)	***49%***

b) The operating business does not need to be worth anything, but it is unlikely to be worth zero
At its current state, the market seems to be right to doubt the value the current operating business. Revenue has remained stagnant at around $16m for several years with minimal growth, and yet the company continues to pour money into R&D and SG&A. However, I do not believe that the poor public performance of the model means that the underlying

technology is completely worthless. Seer has a functioning commercial platform, some recurring assay demand, an improving product suite, and most importantly, a co-marketing relationship with Thermo Fischer, one of the largest life-sciences tools companies in the world.
A strategic buyer also does not need to underwrite Seer's current cost structure. Thermo Fischer, Danaher, Agilent, or another tools company could eliminate much of the standalone overhead and sell Proteograph through an existing commercial organization while integrating the platform with its own mass-spectrometry workflow. Given the rise of AI, I do believe that there is an argument that it should create a tailwind for proteomics. As biological models increasingly integrate functional, multimodal data, the value of large and standardized proteomic datasets should increase, potentially driving more studies, samples, and instrument usage. However, I assign no value to this in the base case, assuming that there is no strategic value in the IP, customer relationship, or Thermo partnership, in an effort to be conservative.

c) The NOLs add another layer of upside without being required for the thesis

Seer also has $262.4m of federal and $226.6m of state NOLs. For the federal balance, the NOLs imply ~$55m DTA at a 21% tax rate. Across a 10-year span at 15% discount rate and at 50% NPV, these federal DTAs can end up being worth another $6.8m or 0.11/share. The state NOLs are less likely to be monetized but again could be worth something to someone. Similar to the operating business, I still assign no value to these NOLs in the base case.

The key point here that I want to hammer in is that there is value within Seer. Between the cash on the balance sheet, while the technology and NOLs can provide additional upside. However, the important next question to ask is if there is a way to stop cash burn and monetize that value from Ser's balance into shareholders, which is where Radoff-JEC matters.

[2] Radoff-JEC group offers a more concrete and shareholder-friendly plan to maximize Seer's value

a) Radoff-JEC timeline of events shows a steady engagement and developed capital return plan

The reason Radoff-JEC matters is that the group has actively looked to push management to return capital to shareholders. They have already put forward several offers that would provide shareholders access to cash trapped on the balance sheet, while still preserving any upside from sale of the Proteograph. The sequence of events shows that the proxy contest was not Radoff-JEC first or even second choice. The group tried private engagement with management, multiple sale offers w/ increasingly higher bids, and finally a large tender before running a slate against the current board. To get a quick grasp on the situation, here's a rough outline of the timeline of events

- **October 10, 2025:** Seer files a preliminary proxy seeking to extend the sunset of the founder's ten-vote Class B shares by five years, which would preserve management voting control through 2030. However, this would violate Nasdaq listing standards, and the board was forced to abandon the proposal.
- **December 9, 2025:** All Class B shares automatically converted 1-to-1 into common stock, reducing Omid Farokhzad's voting power by roughly 40% to ~8%
- **February 20-23, 2026:** Radoff and JEC file initial Schedule 13D disclosing a 6.5% stake and seeking to engage with Seer on strategic alternatives. The group later publishes a letter arguing that Seer could not justify remaining public under its existing cost structure and should look to pursue an immediate sale or capital return.
- **February 26, 2026:** Seer adopted a 4.9% poison pill, an unusually low threshold to restrict the activist's ability to continuing building their position
- **March 2, 2026:** Radoff-JEC disclosed that its combined stake had increased to approximately 7.6% and argued that the poison pill was being used to entrench the board.
- **March 12-20, 2026:** The activists met with the lead independent director and proposed separating the Chair and CEO roles, cutting costs, conducting a $30m-$40m Dutch tender, refreshing the board, and launching a sale process. The board later denied requests that would have allowed each activist to increase ownership to 4.9%.
- **April 13, 2026:** Radoff-JEC nominated Howard Berman, Joshua Horowitz, and Luis Rinaldini and offered to acquire Seer for $2.25/share in cash plus a CVR for 80% of future net asset-sale proceeds.
- **April 24, 2026:** After the first proposal expired without substantive engagement, the group raised the cash price to $2.35/share, offered a substantial reverse break fee, and proposed investing an additional $10m into the company.
- **April 27, 2026:** Seer rejected the revised proposal, arguing that it was below the company's cash and investment balance and did not reflect the long-term value of Proteograph.
- **May 14, 2026:** Radoff-JEC submitted a third proposal at $2.40/share plus the same 80% CVR. The board again ignored and rejected the proposal from Radoff-JEC
- **May 21, 2026:** As a result, the proxy contest formally moved forward after both sides filed preliminary materials
- **June 15, 2026:** Radoff-JEC offered to end the contest if Seer completed a 20m-share tender at $2.50 and adopted governance changes, creating a direct settlement path that did not require a full sale of the company. The board did not respond to the tender proposal.
- **July 28, 2026: Shareholders are scheduled to vote on whether Seer continues under the current board or adds directors from the Radoff-JEC group.**

b) The proposed acquisition structure monetizes the cash w/o forcing shareholders to completely give away the operating upside

The most important part of the Radoff-JEC structure is the separation of cash value from tech value. Under the latest acquisition proposal, shareholders would receive $2.40/share in cash and retain a CVR for 80% of the net proceeds from any future sale, license, or disposition of Seer's proteomics tech. The structure is very similar to Tang-style liquidation, selling at roughly below net-cash and offering a CVR for most of any potential asset sales. For a shareholder, the acquisition would monetize much of the cash on Seer balance sheet, while the CVR gives residual value if the group can find a strategic buyer that would value the science.
This is important because the board's core objection is that $2.40 sits below the company's gross cash and investments. However, the current comparison should not be current cash today, but rather cash that will remain after any cash burn and liabilities. While Radoff-JEC is effectively asking shareholder to take a small discount to net cash today, it offers a better alternative to the current's board plan that does not reach breakeven any time soon.
Even the $2.50 tender proposal would not be a horrible outcome. A 20m tender offer would return ~$50m back to shareholder while retiring ~35% of shares. If the board does believe that the stock is materially undervalued (especially considering its trade below net cash), it seems like a no-brainer to repurchase shares and return capital to shareholder, being highly accretive for remaining shareholders and allowing the board to remain in control. However, at this stage, this tender seems unlikely to happen.

c) Historical results from Radoff-JEC shows moderate success when they can take control of the board

While Radoff and Torok do not have a perfect activist record, their historical campaigns shows fairly successful record of obtaining board representation, forcing a settlement or otherwise gaining real negotiating leverage where they can then push for tangible capital returns. A lot of their previous campaigns can be very relevant for Seer because they have proposed similar structures of returning a majority of cash while trying to retain some exposure to the remaining assets

Sesen Bio / Carisma Therapeutics:

Arguably the most direct comparable campaign is Sesen Bio, a similarly failed biotechnology company that pursued a reverse merger with Carisma Therapeutics. Radoff and other activists opposed the original transaction because they believed that too much of Sesen's cash was going to the pro-forma company rather than the existing shareholders. As such they pushed for a liquidation or a larger capital return. Eventually, Radoff was able to gain an improved deal for shareholder in the merger, with the special dividend increasing from $0.12 to $0.34/share, with Torok actually joining the BoD. This is the clearest precedent for Seer when looking at the activist's previous campaigns.

VirnetX:

Radoff disclosed a stake in VirnetX, pushing for the company to return excess cash to shareholders and the proper distribution from any proceeds received from an ongoing litigation. At the time, most of Virnet's value was from the cash and litigation proceeds, not the recurring business. Several months later, Radoff was able to enter into an agreement with Virnet, as the company paid a $1/share special dividend (while trading at a $1.40) and committed 80% of future proceeds from the litigation. Again, similarly to Seer, the structure seeked to and was able to monetize the current cash balance while preserving upside in other assets through contingent payments.

Guardion Health Science:

Radoff held a stake in Guardion Health Science, a small HC company whose primary asset was Viactiv, a supplements business. Rather than eating the costs of being an underscaled, public company, Radoff pushed for Viactiv to be sold. Guardion ultimately sold Viactiv in 2024 and later liquidated in a voluntary dissolution in what worked for shareholder.

Atea Pharmaceuticals:

Atea Pharmaceuticals is another example similar to Seer that produced a more mixed result. Radoff and Torok pushed for the sale/liquidation of Atea, arguing that they should distribute the cash that they have on their balance sheet. After little success, the group ended up nominating 3 directors for the company's board. However, Radoff and Torok ultimately settled before the shareholder meeting, agreeing to add Howard Berman to the board, authorizing a $25 share buyback, and a lead director not to stand for relection.

While this has fallen well short of the liquidation the activists had hoped for, the group was still able to receive some board representation, some form of capital returns via the buyback, and some governance change that has seen the stock roughly double since.

Tetra Technologies:

Tetra Technologies is the clearest negative example of Radoff and Torok. In this company, Radoff and Torok nominated 4 directors and started an aggressive proxy contest. However, they later withdrew their nominees after a month, giving no reasoning as to why and without achieving any form of capital return. This could mean a multiple of things, but it could suggest that they will not pursue every proxy contest if they think that they can't win. Therefore, it should mean something that they are continuing to run a slate at Seer's AGM

Each of these situations should show Radoff-JEC historical success when achieving control. While the group has not won every contest they have ran in, with several campaigns having ended with partial settlements, the overall outcome has generally included some form of special dividend, asset sale, share repurchase, or something else that is value-additive for shareholders. Thus, if the group is able to win, Seer should see some form of return of capital as a result.

[3] The Radoff-JEC group is better positioned to win the proxy vote than what the market assumes

a) The board lost the structural voting advantage that made prior opposition irrelevant

The largest risk to the idea is that the activists fail to win enough support and the board continues with the standalone plan. However, much of the situation has changed. The biggest difference between the 2025 and 2026 votes is the expiration of Seer's dual-class structure. In 2025, Seer had approximately 4.045m Class B shares outstanding, with each Class B share carrying ten votes. That created roughly 40.45m super-votes, compared to approximately 54.8m Class A shares carrying one vote each. Much of the Class B balance was controlled directly or indirectly by Omid and his family trust, giving the founder close to 40% of the company's total voting power despite owning a much smaller percentage of the economic interest.

However, that situation has largely changed. Despite attempts to circumvent that, Class B shares have been converted to regular common stock. For the 2026 meeting, Seer has only one class of voting stock, with each share entitled to one vote. As of the May 29 record date, approximately 55.3m shares were outstanding and entitled to vote. Omid remains a meaningful holder, but his voting power has significantly decreased. Furthermore, alongside the sunset of Class B shares was the declassification of directors. All seven directors stand for election each year, giving Radoff-JEC the opportunity to immediately create change if they are able to win.

While, the poison pill does limit Radoff-JEC's ability to purchase additional shares, but it does not restrict SoftBank, aMoon, or other existing shareholders from voting for the activist nominees. In other words, the board has limited how much support the activists can buy directly, but it cannot recreate the prior super-voting structure. Radoff-JEC must now win through persuasion, but the board must also win through persuasion rather than relying on the founder's voting control.

b) The 2025 withheld vote already showed meaningful dissatisfaction beneath the super-voting block

Even before Radoff-JEC launched its campaign, Seer's 2025 election showed that a meaningful portion of the outside shareholder base was dissatisfied with the board. The clearest example was Terrance McGuire, who received approximately 59.66m votes FOR and 10.03m votes WITHHELD. On these numbers, it implied that roughly 14.4% of votes were withheld.

On its own, it is already a meaningful % for an uncontested director election, especially when there as no competing nominee and withholding a vote would not realistically be able to alt the board's composition. However, these votes also include the founder-controlled super-voting Class B shares that had a 10-to-1 voting right, substantially diluting the visible opposition from regular shareholders. Using that, we can try back into what the implied actual opposition was for the director.

- **Step 1:** Calculate the total votes cast on McGuire's election. McGuire received 59.664m votes FOR and 10.031m votes WITHHELD, resulting in approximately 69.695m votes cast. Broker non-votes are excluded because they were not votes either for or against the nominee.
- **Step 2:** Calculate the maximum Class B voting block. Seer had 4.044969m Class B shares outstanding, with ten votes per share. This created approximately 40.450m Class B votes.
- **Step 3:** Estimate the votes cast by non-Class-B shareholders. Assuming the Class B block was voted and supported the incumbent slate, I subtract the 40.450m Class B votes from the 69.695m total votes cast.
- **Step 4:** Divide the withheld votes by the estimated non-Class-B votes cast. This gives an adjusted estimate of the opposition beneath the super-voting block.

Under this methodology, the withheld vote represented closer to 35% of the estimate non-Class B votes rather than the surface level 14%. And while this is an estimate based on the reasoning above, it does show how dissatisfaction even last year was higher than what was initially expected, especially considering any opposition would essentially fail. The opposition was also not isolated to McGuire. Dipchand Nishar received approximately 6.55m withheld votes. Using the same estimated 29.25m non-Class-B denominator, that equals roughly 22.4% of the outside vote cast. Nicolas Roelofs received approximately 5.86m withheld votes, which equals roughly 20.0% on the same adjusted basis.

More importantly, the 2025 votes occurred before much of 2026. At the time, shareholders had not yet seen the board attempt to extend the Class B structure, adopt a 4.9% poison pill, reject three increasingly higher acquisition proposals, or ignore a $2.50 tender settlement. Therefore, the 2025 withheld votes should be viewed as a starting point for opposition, not necessarily the ceiling.

Putting everything together, I do not think a Radoff-JEC victory is guaranteed. The group still needs meaningful support from SoftBank, aMoon, and the broader shareholder base, and large holders may ultimately prefer continuity or negotiate for a settlement. However, the vote is much more competitive than the activists' 7.8% position suggests. Radoff-JEC enters the meeting with a meaningful economic stake, two large outside holders whose capital has been trapped in an underperforming structure, a universal proxy that permits a mixed slate, no super-voting block, and evidence that a sizable portion of ordinary shareholders was already dissatisfied before the current campaign began.

c) Despite being entrenched, the board is incentivized to maximize shareholder value

Although I have spent much of this writeup outlining how entrenched Seer's board has been, I do not think it is completely fair to say that management's financial incentives are completely misaligned with shareholders. Directors and management collectively own roughly 7.6m shares, or approximately 14% of the company. At the $2.45/share cash value now proposed by both sides, that stake is worth approximately $18.6m. If Seer's net cash value is ultimately realized closer to $2.60/share, the stake would be worth nearly $20m. Omid's ownership alone would be worth more than $10m. That amount is fairly substantial relative to the cash compensation the group receives from continuing to operate Seer. Omid earns roughly $0.6m in annual salary, while management's annual bonuses and other cash compensation are generally measured in the low-single-digit millions. The board may still value control, continued employment, and the ability to pursue the science, but those benefits have to be weighed against a direct equity position worth multiples of annual compensation. As a result, the incentives are not as simple as management wanting to keep burning cash forever.

This does not mean the board will automatically agree to Radoff-JEC's preferred outcome. The board has already shown that it is willing to defend the standalone strategy, and insiders may place a value on control that is difficult to quantify. However, meaningful insider ownership reduces the risk that management is economically indifferent to the balance-sheet destruction. It also increases the likelihood that, under enough proxy pressure, the board will look for a transaction that preserves some control or operating upside while still crystallizing the cash value for shareholders. Instead, you might reach an outcome where Radoff-JEC looks to Omid to take the company private. This would also be a welcome outcome in our eyes

[4] UDPATE: Omid's take-private proposal creates a second path to realizing value

Now, I will admit that this section is a little bit rushed in an effort to update the idea with happened earlier. However, earlier today Omid ended up submitted a proposal to take Seer private at a $2.45/share in cash plus two CVRs, one being tied to revenue milestones and then second being linked to any asset or licensing sales related to Proteograph. Omid stated that the proposal is not subject to a financing contingency and requested that an independent special committee evaluate both his offer and the Radoff-JEC alternative

To me, the immediate takeaway is that the founder essentially agrees with the central part of the activist thesis. Seer should not remain a public company under the existing structure. However, Omid seems reasonably more bullish on Proteograph, arguing the quarterly earnings cycle does not fit with the long-term nature of developing Proteograph, contrasting from Radoff-JEC simply arguing that the revenue base it currently has is not sustainable.

The offer Omid makes at $2.45/share upfront matches the latest Radoff-JEC cash price described in his letter. Despite the two parties having very different views on Proteograph, both have converged on the same amount of immediate cash value. Radoff-JEC wants to return the balance sheet and monetize the platform separately, while Omid wants to keep investing in the platform as a private company. However, both proposals recognize that public shareholders should receive approximately $2.45/share in cash today.
I think that this creates a couple of very interesting points to evaluate which of the offers is better. To start, the biggest difference between the two offers is not the $2.45/share but rather what each party believes should happen to Proteograph after the acquisition. Based on his tone in the letter, Omid's proposal is effectively a bet that Proteograph can become operationally viable through continued investment and operation execution. His first CVR is tied directly to milestones in 2031, while the second is tied to a future sale, license, or strategic transaction involving those assets. I'd expect Omid to prioritize funding and sole ownership over the platform rather than a sale. Radoff-JEC proposal seems to be different. Their offer is less reliant on proving Seer can become a successful standalone operating company, but rather that they would attempt to immediately monetize Proteograph. Instead, the group would look to sell or dispose the asset to a strategic buyer. In other words, Omid is betting on the future viability of the Proteograph, while Radoff-JEC is betting that the tech is worth more to strategic as an add-on product.
Between the two plans, I still prefer Radoff-JEC. The issue is that shareholders have already spent several years funding the operating vision Omid has had with limited success. While it is possible that the platform eventually inflects by 2031, there simply is not enough commercial evidence for me to assign some meaningful value to a CVR tied to future revenue. And while the Radoff-JEC plan is also speculative, I see the path to the CVR being successful far more likely. As we mentioned earlier, a large life-science tools company could potentially value Seer's tech differently because it treats is as an add-on product rather than a standalone. Thermo Fisher, Danaher, Agilent, or another strategic could integrate Proteograph into an existing mass-spectrometry platform, remove redundant public-company and commercial expenses, and monetize the technology through a much larger customer base. Rather than asking Seer to prove that it can independently scale revenue from ~$16m to a profitable level, Radoff-JEC would try to find a buyer that can extract more value from the platform than Seer can on its own.
This does not mean Omid's proposal has no value. Rather, the offer shows that there is reasonable value here that Omid is willing to acquire. Even if I prefer Radoff-JEC, Omid's offer creates a second path to capital return and potentially some form of bidding war. Both offers are very similar in the sense that they can essentially use Seer's net cash to fund the acquisition, pocketing the difference. As such, there may be some room for a bidding war to increase the upfront consideration or improve the CVR terms.
While it is a low likelihood event, I don't think it's reasonable to say that Omid can end up bidding more in order to preserve control of the platform and personal ties to the company. If a bidding war does end up happening, it's hard to see how Omid won't end up winning, but hopefully that would end up in a situation with a meaningfully higher upfront cash or better CVR terms. Add in the upcoming AGM and it acts as a catalyst for which we can see what will end up happening.

Conclusion
I do apologize as much of the post was written prior to Omid's offer, which did meaningfully change the idea. However, I think the situation still is attractive, with the situation potentially being a "heads, I win; tails, I don't lose much."
I do not hold a position with the issuer such as employment, directorship, or consultancy.
I and/or others I advise hold a material investment in the issuer's securities.

Member acm2025

Totally get the frustration of putting in a bunch of work only for it to become OBE before posting. But putting that aside, it's trading at $2.30. Do you still think it is a buy at $2.30? What is the avenue to realize more than 15 cents of value at this point? Thanks!

Hey ACM,

Very fair comment and completely agree with the tags. I think at these prices, the idea changes from being “will they be able to monetize to BS” to a more of a CVR and merger question. I talk about it a little at the end of the writeup, but I do think that it is interesting that Omid and Radoff-JEC have not engaged despite offering similar offers. To me, it’s clear Omid values this business on personal level and wants to remain in control, regardless of its public or private. And based on him making an offer at this stage, it hints that the only path forward is as a private company.

All that to say, is that I think the a deal with close atleast at $2.45 with CVRs. Depending on the net cash burn expected and how much value Radoff-JEC see in Proteograph, I also would say there’s a chance you could see a bidding war (as I think Omid will pay a significant amount to retain control), but I’ll defer that point to the merger arb guys that know more than I do.

Subject CEO's offer rejected...next move?
Entry 07/20/2026 09:36 AM
Member UCB1868

Omid's offer was rejected and we've got the vote coming up...what are the scenarios? It seems like Omid and the activists are ready to go private, but the board either wants to stay public or is looking for a higher bid. It seems to me that if Omid really wanted to own the company, he would have put forth a higher bid from the outset. Maybe everyone agrees to put the company up for sale?

Subject higher offer from Radoff group

https://www.businesswire.com/news/home/20260728198047/en/Radoff-JEC-Group-Submits-Further-Improved-Proposal-to-Acquire-Seer-Inc.

I suppose this means that they expect to lose the proxy vote?
