Description

Alright guys, this is a short one, since it's more time-sensitive special sits vs the long form thesis like VBNK. But don't think for a second that the work here is any less in-depth.

Fermi is a mega-project AI DC in Amarillo, TX, built by Quantum Energy Co-Founder Toby Neugebauer (more on him later) and Former Energy Secretary/Texas Governor Ricky Perry (aka. Good Hair Perr as we say in some circles in Texas). It is a pre-revenue AI power campus developer (REIT) sitting on 7,500 acres in the Texas Panhandle with \$1.4B of physical infrastructure on-site, a 6 GW gas-gen approved air permit, ~\$1B of equipment financing from real institutional lenders (MUFG, Keystone, Beal Bank), and 2.2 GW of gas generation equipment either on-site or under firm contract across four turbine platforms from two OEMs. But importantly, no customers.

The company IPO'd in late '25, reached a high of ~\$37 per share, and then suffered a slew of horrible, no-good news mainly due to the co-founder/CEO's ego. After a lot of drama, the adults are in charge, and the street is looking through the rear view. We see the governance overhang resolving by late June/July and the binding tenant catalyst hits within 90 days of the May 14 earnings call (mid-August). If you're going to look at this, look at it now, as we see some "tells" in the near-term that give us confidence on a re-rate in less than 60 days.

Basically, this is Applied Digital on steroids, with more power on tap, a structurally tighter power market, and more noise. At less than \$6, you're paying a ~2x book value for a permitted gigawatt-scale power campus in a structural power shortage. **With an actual tenant it's quite reasonable to see this trade back up to the \$30's when FRMI just had an LOI and a whacked-out CEO.**

From there we see a long-term thesis in lock step with execution on power capacity increases, from 200 MW today to up to 6 GW of gas-fired power. **Once the full 6 GW is operating, the math is a straightforward REIT valuation: \$100+/kW/mo with margins on par with peers, capitalized at a 5% cap rate, less \$6B of project debt, equating to roughly \$150 per share.**

Ultimate capacity is cited as 17GW with another 5 GW of gas power and a new-build nuclear plant (4.4GW). But the nukes aren't really on the table until the 2030's. Table that for now, it's years out and consuming no capital today, though it's worth noting the company holds the first construction permit issued for a newbuild nuclear plant in 15 years.

How We Got Here (Ego)

Toby Neugebauer co-founded Fermi in January 2025 with former U.S. Energy Secretary Rick Perry. To his credit, the man moved fast, he secured 7,500 acres from Texas Tech on a 99-year lease, filed for a 6 GW air permit with TCEQ (all of which are approved now), submitted the first nuclear COL application the NRC has accepted in 15 years, procured gas turbines from two OEMs, and got the company from founding to NASDAQ IPO in nine months. Genuinely quick execution and it helps when you have an impressive rolodex and tons of cache in Texas, a famously build-first ask questions later state.

Then it all went to his head. His investor presentations were erratic, it would be generous to say he looked like he was on something. The IPO prospectus leaned heavily on a single tenant LOI signed September 19, eleven days before the October 1 listing. The LOI was non-binding. The tenant was widely reported as Amazon (Business Insider, December 2025). Fermi denied it via Reuters, but Toby was telling everyone in meetings etc. The exclusivity period expired December 9, the \$150M construction advance agreement was terminated December 11, and no funds had ever been drawn. The stock dropped 35-40% overnight.

Per the Cantor Fitzgerald analyst, the LOI "stalled because of a disagreement over pricing." He characterized Fermi as having "pricing discipline." Okay, Jan. The tenant didn't leave because the asset was bad, it's more likely Toby was on tilt and overplaying his hand.

Speaking of Cantor, more evidence of Toby's erratic behavior included getting into a physical altercation with Howard Lutnick over getting a Commerce Dept loan and verbally accosting a Google executive. Of the top five biggest AI DC spenders, Toby pushed away two. Great work.

The board terminated Neugebauer for cause on April 17, 2026. He immediately started a proxy fight, that has been graciously characterized as "irrational" and "just pure ego." The CFO (Miles Everson, a Neugebauer loyalist who sold stock eight days before the firing) resigned two days later. Fuzzy Panda dropped a short report on April 20 calling the project "a field of dirt." (Hint. It's not) The stock hit \$4.47.

Then the board got things together, most notably they laid out Fermi 2.0 on the Q1 earnings call, where they presented five points to get the company back on the right track, and also gave us incremental info on the situation. Namely, more proof that Toby was the problem, and that the board did the right thing.

Co-President Anna Bofa said on the Q1 call: "Tenant conversations that had previously stalled have been re-initiated, and new prospective tenants have entered our data room." Chairman Marius Haas was more direct: "the Board recognized that over the next 18 months, Fermi needs to operate differently. We need to execute multi-billion-dollar contracts with investment-grade counterparties."

Translation: potential tenants did not want to sign a 20-year, multi-billion-dollar lease with Toby Neugebauer as their counterparty. The risk committees at these hyperscalers would not approve of it. Once he was removed, the commercial door re-opened. From everything we've diligence, the current management set up, even with the remaining Toby proxy noise is clean enough for hyperscalers to engage and sign contracts. Proof to that effect in the next few sections.

The Proxy Fight, and Why It's Almost Over

Neugebauer owns 43.5% (278 million shares across personal, Vicksburg Investments, and his wife's trust, acquired pre-IPO for fractions of a penny...Nice). He called a special meeting for May 29 the same day he was fired. The board cancelled it. He sued. The court denied the board's TRO, but the board cancelled the meeting anyway and adopted a bylaw amendment raising the director-seating threshold from 50% to 70% of all outstanding shares. The 50% threshold to call a meeting via consent solicitation is unchanged.

Neugebauer is now running a consent solicitation to call a second meeting around June 30. He does not want to be CEO but wants to install enough of his cronies on the board to

have control and “dual-track” operational execution and shopping the company. The board pointed out engaging in a sale is not the best course of action, though of course they’d look at unsolicited bids. They are acting with actual fiduciary duty.

To the boards point, why would a hyperscaler do a deal and then have to talk to a whole new set of owners? A sale process gets in the way. Haas addressed it directly on the call: "our former CEO's ill-advised call for an immediate sale of the company. The Board has carefully considered that view and rejected it outright. A forced sale at this moment is not in the best interest of the long-term shareholders, especially with anchor tenant negotiations advancing and our financing structure intact."

Not happening, execution is the name of the game and the board knows it.

In numbers, Toby needs consent from 50.1% of outstanding shares. He has 43.5%. He needs another 6.5%. He is not getting it.

If you were to only look at his LinkedIn and X posts, that would be enough to tell you how it’s going to go. There is shockingly no engagement other than “step aside man” posts.

But more seriously, when tallying votes here: Caddis Capital, the next largest holder at 9%+ (part of Team Perry), have sided with the board. From investor calls with other holders, we see that he is likely unable to meet the 50.1% to even call a meeting, much less meet a 70% threshold to nominate a board member.

There are two pending lawsuits, one on that 70% threshold for board nomination. Even if he wins and the bylaws change, he has yet to have enough votes to call a meeting...

Side note, the filings in these cases have some amazingly bizarre behavior in them, further solidifying the board’s decision. Both lawsuits should be resolved by late summer, hearings in late June/early July. If he can’t call a shareholder meeting by June 30, he’s pretty much done. If he continues the company is likely to issue a TRO or something to get his noise out of the discourse. At some point his actions would be some form of market manipulation.

Either way by end of summer, we expect Toby’s most impactful BS resolves one way or another. Though there’s still noise likely to occur given the irrationalness of it all. Though we doubt he will sell his shares if the company executes.

The Re-Rate: Hitting Fermi 2.0 Milestones

Now, on to the setup outside of the drama.

On the Q1 call, the new management team said prospective tenants have been visiting the site, conversations are "increasingly specific" and moving from "interest to execution," and **they expect to announce binding agreements when signed in less than 90 days.**

That is probably the most important thing. Of which we believe there is ample evidence that Amazon is going to say yes to Fermi. We’ve seen this play out in Applied and a few others who we’d describe as crap bitcoin miners, and yet they have what the hyperscalers wanted so contracts were signed. And if anything, power demand is higher than ever. **We think a deal will be made in the next 60 days.**

For completeness, here is the 2.0 five-point plan, all of which the company has been yelling from the rooftops that they will achieve in 90 days.

Fermi 2.0

1. **Attracting premier tenants** who recognize the unique value of the platform
2. **Building the best private power grid** in close collaboration with suppliers and partners
3. **Ensuring sufficient capital** to support liquidity needs
4. **Accelerating strategic partnerships** in both power and data centers
5. **Investing in people and talent pipeline** including key leadership additions (CEO search underway with Heidrick & Struggles, "preliminary slate of highly qualified candidates already in hand")

The company is also planning an investor site visit in late June. If you want to see whether 261 acres of prepared ground, 4.6 miles of gas lines, 7.2 miles of water lines, turbine foundations, and a 2-million-gallon water storage tank are real or a "field of dirt," that's your chance.

Amarillo is a wonderful place to do nothing. Which is exactly why you don't bring a planeload of investors there empty-handed. Doubtful they want yet another hit to their credibility. Sure they could be masochists, but that still seems better than whatever Toby is.

Another interesting datapoint here is that Texas Tech University (TTU) can pull its 99-year lease at year end if there’s not a tenant. **Critically, the Toby drama put Fermi in actual violation of its TTU lease agreement in April, but TTU waived it after talks with the company. Wonder what they discussed, maybe they now see a path back to a tenant...**

With that said, if they announce a binding deal, we think FRMI is off to the races and we get back to \$30+ quickly on just what they have in front of them in the next 12-18 months.

So, what are FRMI holders getting in terms of power in the near-term?

Power Plan

Quarter	Addition	Cumulative (Derated)
Q4 2026	86 MW Xcel grid + 114 MW GE Vernova FR6B (3 units, in Houston refurb, foundations poured at site, completion expected June 2026)	200 MW
Q2 2027	+294 MW Siemens SGT-800 (6 units, cleared customs at Port of Houston, foundations being prepped – Units not moving until tenant deal)	494 MW
Q3 2027	+124 MW GE TM2500 (7 units, 20-year lease, in Houston) + 114 MW additional Xcel ramp	732 MW
Q4 2027	+726 MW Siemens SGT6-5000F (3 F-class heavies — GT#1 and GT#2 complete in North Sea port, GT#3 in final assembly in Germany, delivery Q3 2026)	1,458 MW

That gets you 1.5GW in the near term. Nothing to scoff at. Rental prices appear to be over \$100/kW/mo, all reasonable looking around at some peers.

Beyond 2027 there's 6 additional Siemens SGT-800 turbines (secured, Beal Bank \$165M financed, delivery 2028) bring total generation equipment to ~2.2 GW.

The remaining ~3.8 GW of the 6 GW permit is unordered and tenant-dependent. But in this environment, expect that to be taken care of once they can bootstrap it with customer #1 online.

Permit #2 (additional 5 GW, filed March 2026, expected Q4 2026 per Haas) takes total permitted gas capacity to 11 GW.

The Four AP1000 nuclear reactors (4.4 GW, COL application accepted by NRC, Hyundai E&C doing FEED, Doosan commenced forging dies for reactor pressure vessels) are 2037+ optionality. To be fair, everyone has talked down nuclear even though the company has good political connections (Thanks, Perr).

Next is how much money they have raised and spent it on.

Financing Stack

Lender	Commitment	Drawn	Purpose
MUFG	\$500M	\$397M	3 Siemens F-class turbines (also repaid Macquarie)
Keystone National Group	\$120M	\$40M	Transformers, substations, switchgear
Beal Bank	\$165M	\$3M	6 Siemens SGT-800 turbines
Yorkville	\$156M	\$0	General corporate expenditures
Total	\$941M	\$440M	

Plus \$243M cash on hand (\$208M available). The Yorkville facility (\$156M, fully undrawn) is the general corporate runway.

On the actual cash burn: Masson reported \$7M of cash used in operations, but that included a \$22M working capital benefit from AP/accruals growth. Stripping that out, normalized operating cash burn was ~\$29M for the quarter. CapEx was \$441M but that's the Phase 0 buildout that is now paused until a tenant signs. Going-forward burn should be dramatically lower. The Yorkville facility alone covers 5+ quarters of \$29M/quarter normalized operating burn. Again, with a tenant and some pre-payments, no big deal.

To scale up to 6 GW they likely need another \$5B in project debt, no biggie in this environment.

Now if they don't get a tenant, the Siemens plants can be pulled back by the lender. Shot clock there is November 2026. And TTU can pull the lease by year end if there's no tenant. We see that as a lower probability, but again we also don't think the people in charge today are incompetent. We could be proven wrong there, however.

Valuation Framework

Making this as simple as possible we lay out today's prices and expectations, with several scenarios. **Though we did include a blue-sky case, absurd by 2024 standards, and yet probably conservative by 2026 ones.** We don't make the rules, those with equally bad operating performance and assets have put up better performance than old us would have thought. **Plus to-date nothing about the environment has gotten weaker, in fact it's likely the opposite with the big AI DC spenders being extra flush with cash.**

Market-implied setup

- At \$5.80: market cap ~\$3.5B+, EV ~\$3.8B+
- Against ~\$1.4B net PP&E, market assigns \$2.3B+ of franchise value to a zero-revenue company
- The debate: is the franchise (permits, site, interconnection, procured turbines) worth \$2.3B or multiples of it?

Bear case (\$2-3/share, 10% chance) No tenant, forced raise

- No tenant signs; dilutive equity raise at \$4-5 to fund part of the buildout to 1.5GW to show they're serious about even getting a tenant.
- Liquidation: \$1.43B PP&E at 50-70 cents on the dollar, minus \$421M debt = \$2-3/share
- Requires believing no hyperscaler wants a permitted 6 GW behind-the-meter campus in Texas while spending \$250B+/year on AI infrastructure

Base case (\$40-45/share, 40% chance) 2 GW stabilized

- Tenant signs 500MW-1GW within 6 months, governance resolves
- Revenue ~\$2.4B at \$110/kW/month, 90% occupancy
- EBITDA ~\$1.5B at 62.5% margin; NOI ~\$1.6B at 66% margin
- AFFO ~\$1.2B at 51.25% margin; AFFO/share ~\$1.91 on 638M undiluted
- FFO/share ~\$2.05; dividend/share ~\$1.53 at 80% payout
- ~\$570M incremental capex, all debt-funded, no equity raise; total project debt ~\$1.0B
- 5% cap rate on NOI = ~\$47/share; discounted 5-10% for construction/ramp risk = \$42-45
- At 18x AFFO = \$34; at 20x FFO = \$41 — multiple approaches bracket \$35-47
- Achievable with currently procured turbine fleet by end of 2028

Bull case (\$150/share, 30% chance) 6 GW, full Permit #1

- FFull de-risk: multiple binding leases, new CEO, governance resolved, strategic partnership
- Revenue ~\$8.1B at \$120/kW/month (pricing power with multiple tenants competing for capacity), 90% occupancy

- EBITDA ~\$5.1B at 62.5% margin; NOI ~\$5.2B at 64% margin
- AFFO ~\$4.2B at 51.25% margin; AFFO/share ~\$6.50
- ~\$5B incremental capex from 2 GW to 6 GW, all project debt backed by contracted revenue
- Total project debt ~\$6B, interest ~\$390M, covered 13× by NOI
- 5% cap rate on NOI = ~\$150/share
- Requires filling full permit with multiple hyperscalers over 3-5 years

Blue Sky case (~\$250/share, 20% chance) 11 GW, both permits, full gas campus

- Revenue ~\$14.9B at \$120/kW/month, 90% occupancy
- EBITDA ~\$9.3B at 62.5% margin; NOI ~\$9.5B
- AFFO ~\$7.6B; AFFO/share ~\$11.95
- Total project debt ~\$10B (EQIX carries \$20B+ against \$9.6B revenue for context)
- 5% cap rate on NOI = ~\$250/share on current share count
- 2032-2035 outcome if everything executes

Expected value

- $(10\% \times \$2.50) + (40\% \times \$45) + (30\% \times \$150) + (20\% \times \$250) = \sim\mathbf{\$113/share}$
- **vs. \$5.80 today = ~19x expected upside.**
- **As far as assumptions, we gave FRMI a 25% premium above EQIX margins as a comp. That could be conservative.**

Risks

Primary risk: no tenant signs by November and the company needs dilutive capital to keep the power equipment they have financed. Secondary: proxy fight drags past summer and creates permanent governance uncertainty. Third: something worse than currently known emerges from class actions.

I do not hold a position with the issuer such as employment, directorship, or consultancy.

I and/or others I advise do not hold a material investment in the issuer's securities.

Just published here and looked at the price. Supposedly OpenAI looking at a deal with FRMI too.

Of course.

Subject Yorkville
Entry 06/10/2026 02:20 PM
Member offtherun

I own a bit of this but wasn't happy to see a shop like Yorkville in the cap structure. Any thoughts as to why would they get into bed with someone like them if everything is so wonderful? Only thing I could come up with is that there was no one else at the table. How concerned are you with Yorkville and dilution?

thx

Subject Re: Yorkville
Entry 06/10/2026 02:34 PM
Member agentcooper2120

Don't think anything I've described is wonderful, I get it though. But the direction of travel going forward likely to be far better than what's it's been. Which is the point here given the hair.

On Yorkville, agree. Solace there is it's not a lot of capital in the grand scheme and likely came in as lender of last resort to bridge the gap until if/when they get a tenant. The company had \$0 drawn there IIRC but dilutive.

If they execute don't think there's much of a need for dilution and the board certainly isn't doing it down here. But a raise to accelerate to a full 6GW would be seen positively.

Subject Re: Yorkville
Entry 06/10/2026 02:42 PM
Member T0YPAJ182

The Yorkville deal is described as an equity-of-last-resort by the company. Say capital market's aren't open in a scenario in Q3/Q4 of the year, consider this an ATM that they could tap. It IS dilutive, and yes I ALSO HATE YORKVILLE, and got a bad taste in my mouth when i saw this.... but they are not using this unless under extreme durrress. I will also say, this deal was struck under Crazy Tobey Neugebauer. good riddance!

Also - appreciate the writeup agentcooper. Very involved here, and think this is one of the best r/r situations in the infrastructure market right now. Not without it's risks! One thing I'd recommend revisiting is the capital intensity you're assuming... ex: "~\$5B incremental capex from 2 GW to 6 GW, all project debt backed by contracted revenue" hate to say it but this is a low estimate.

Good part is, when the Tenant #1 (amzn) contract is signed, there is going to be (this is my infering / reading tea leaves) there will be an equity stake associated with the commercial agreement. this will help massively in the project financing (will give them cash to put up in whatever debt/equity ratio they decide). AMZN will also make a killing off their equity investment. Bit of a no-brainer.

Entry 06/10/2026 02:52 PM
Member agentcooper2120

Thanks for the comments. Yes Yorkville was definitely a Toby special. As I stipulated at the beginning this was a much quicker style write up. My VIC equivalent of "sent from my iPhone" so excuse the typical lack of hyper vigilance that comes to my usual write ups

The details help so thank you, will refine the capital intensity etc. But ultimately we did enough work here on the important things that drive this thesis and I wanted to write it up as quickly as possible. As you can see today. Also running up on my 2 idea deadline and didn't want to defer. Probably going to get some hate for that but oh well hah

Subject ASPI
Entry 06/10/2026 04:19 PM
Member bafana901

Pretty sure (90% probability) ASPI is a fraud. Maybe this can also be blamed on the old CEO. What are the chances the whole thing is rotten?

Appendix – Questionable Partners for Fermi's Pipe Dream Plans

• Partnered w/ ASPI – Paid Stock Promotion Connected to “Microcap Fraudsters”

Fermi's Strategic Partner ASP Isotopes is a Paid Stock Promotion Connected to Well-Known “Microcap Fraudsters”

One of Fermi's newest strategic partners is ASP Isotopes, a paid stock promotion filled with “microcap fraudsters.” If you want to read more about ASPI, their virtual co-working space HQs, worthless old tech, and the infamous stock promoters behind the company we recommend you read our Nov 2024 [short report](#) on ASPI. ASPI's stock has fallen -43% since vs other nuclear company's gaining +87% on average.

In [August 2025](#), Fermi and ASPI signed a non-binding MOU to pursue a Texas-based collaboration for nuclear fuel production. So essentially Fermi – an overvalued plot of dirt – set up a [Texas JV](#) with a uranium enrichment company had never even enriched uranium. Even funnier Fermi says ASPI is going to lease space at its HyperGrid campus. Good luck with that Fermi, ASPI keeps a virtual headquarters and didn't even lease real office space.

We just wish it was possible to find borrow and short the JV.

Member	T0YPAJ182

TLDR: backwards looking short report

90% of the report is talking about the CEO. then, the board kicked him out because the tenant said this was the problem. Problem solved. That's why they haphazardly had to drop the short report ASAP. the #1 point of concern, is kicked out, and he can't sell (lot of roadblocks). Hence why he's trying to take over the board (0% chance) and sell the entire company outright so he can monetize his founder shares.

I have been to the site (2x). id recommend seeing it, especially if you've seen some of the btc miner sites in person (wulf, riot, cifr, corz, etc). Anyways: their analysis of site is outdated by about 7 months. they even put disclaimers underneath the pictures saying we went in like nov/dec.

the air permit issue is a nothing. if you make a few calls w a legal team you'll find out how difficult and rare it'd be to have it reverted.

Is there hair on this company? one hundred percent.

Great write-up, have been in this name too. As a note, AWS posted a job posting for a Data Center Ops Leader back in November (When deals fell through, Toby N publicly stated it was AWS, before Fermi recanted).

Amazon Web Services (AWS)

Data Center Cluster Operations Leader, Amarillo

Texas, AMER MLZs

Amarillo, TX · Reposted 1 day ago · 49 people clicked apply

Promoted by hirer · Responses managed off LinkedIn

And was reposted beginning a few days ago. Amarillo is the closest city to the Fermi plant (Pantex is right next to it), and where Fermi corporate offices are.

Subject Entry Member	Re: Job Postings 06/13/2026 05:08 PM MrStingy
Alright guys we need someone who is qualified to click apply and get an interview and let us know what's going on with this position. Sadly not me	
Subject Entry Member	Re: Re: Job Postings 06/13/2026 05:26 PM agentcooper2120
Load up the job posting in AI and have it spit out a resume that would go through their algos perfectly and move to the front of the line. How's that for a circular deal?	
Subject Entry Member	Toby N on X 06/14/2026 11:22 AM angus309
Social media was mentioned in this excellent pitch, but thought I'd mention that Toby has barely over 100 followers on X, and responses to his active postings have been 99.9% negative / against his plans. I found only one luke-warm reply. Toby appears genuinely reviled.

agentcooper2120

Gov. Abbott, who is a political and personal friend to Fermi co-founder Frmr. Gov. Rick Perry, announced the other day that the State of Texas will put guardrails on data center build outs including mandating no power increases to consumers and no power interconnects paid for by tax payers, water restrictions etc.

<https://gov.texas.gov/news/post/governor-abbott-directs-puc-and-ercot-to-shield-texans-from-data-center-infrastructure-costs>

What I'll detail below should surprise no one given how I framed it, but the TLDR is this new directive looks tailor made to benefit FRMI. In fact FRMI is the only project with GW-scale unaffected, shocker... This directive imposes incremental costs and regulatory burden to 95% of the DC power likely to come online in the next few years.

Here's the breakdown.

Texas has over 400 GW of DC projects in line for power connection. Many of these are phantom bids and won't be built, the best cut we have is ~75 GW planned capacity coming online in 5-7 years. 50% of that capacity is spec'd at 100% grid powered (good luck now), ~30% is hybrid, and less than 20% is fully behind the meter around 13GW.

FRMI is 11 GW of that planned 13 GW capacity. The others are a couple of 1 GW plants (built in 27/28).

Of those with permits that can be online in less than a year, that's FRMI at 6 GW....

In what could have been a power supply ocean, Texas has very conveniently just left hyperscalers with one option to scale up that meets these new directives... Just in time to get a deal done.

Thanks, Perr.

agentcooper2120

Last one from me on this today, but as we have laid out, Toby doesn't even have the votes to call a meeting. Company PR out this morning as they push their view to shareholders.

Fermi Files Definitive Consent Revocation Statement and Mails Letter to Shareholders

No Special Meeting of Shareholders Has Been Called

Toby Neugebauer Currently Does Not Have the Required Support to Call a Special Meeting of Shareholders

Board Urges All Fermi Shareholders to Protect Their Investment by Returning the WHITE Consent Revocation Card

Emphasizes Strong Momentum Behind Fermi 2.0 and Continued Advancement of Project Matador

DALLAS, June 15, 2026 /PRNewswire/ – Fermi Inc. (NASDAQ: FRMI) (LSE: FRMI), operating as Fermi America™ ("Fermi" or the "Company"), today announced that it is mailing a Consent Revocation Statement to shareholders enclosing a WHITE Consent Revocation Card in response to the consent solicitation by former Chief Executive Officer Toby Neugebauer seeking to call a Special Meeting of Shareholders ("Special Meeting").

The Company noted that at this time no Special Meeting has been called, as Mr. Neugebauer, who was terminated for cause, currently does not have the support required to call a Special Meeting. As a result, no Special Meeting date has been set for July 15, 2026, and no notice of a Special Meeting has been issued. If a Special Meeting is called, notice will be given by the Company in accordance with the Bylaws.

I've heard this company described as the development partner of last resort. I get there is power - but it took APLD building multiple data centers on spec to be appreciated enough by hyperscalers to work with them, and APLD has a very real development team now. Is there anyone at this company that is capable / credible enough to attract a real hyperscaler tenant?

So, APLD is a vertically integrated operator while FRMI is a REIT w their own power. Different models and different areas of expertise required to land a customer.

APLD had to show operational expertise and prove out TCO etc because they were managing the GPUs etc.

FRMI needs to build the shell and manage the power. The customer then manages the hard part, the GPUs etc. As a landlord with power you need scale on site and permits etc.

Construction and power management expertise, not cloud management, is what's required. On that front, 2 GW of equipment ready to go, 6GW of permits, and a facility w space for 11 GW+. Think the people there managing that part have what is required (excluding Toby which we believe is 99% of the hair). And then there's some political connections that appear advantageous.

If it looks like a duck, swims like a duck, and quacks like a duck, it's probably a duck.

APLD doesn't manage or touch the GPUs for the DC's they were building on behalf of hyperscalers. They are a colo developer, which means they build out the building and MEP but not the server/GPUs inside the DC. That's what a "REIT" would do - like DLR or EQIX.

Fermi is building powered shell which is less specialized, but looking at their website they still don't seem to have anyone that has development experience, which is still required to work with hyperscalers. I also think they have pretty limited power experience as well (outside of getting turbines because they were close to the Trump administration, which doesn't make them power experts but just well connected people) - would be curious who you think is driving this bus now that Toby is gone.

Could they sign a lease? Sure. I think their best course of action is to bring someone in as a JV partner. The bottom line is i don't think this is a Toby only issue.

Quote from Caroline Golin, who is the CGO at NRG and former head of energy at Google, from a podcast April 30th:

Caroline Golin: Yeah. I will say in that window between Google and NRG when I was advising, there were a couple of shops where they came to me on this and I was very clear with them. I would not engage. I don't see the through line there. I don't think it's a smart investment and they were shocked and I think they didn't work with me because of my stance on this and I'm like, told you to some degree. I mean, I think like I said this to Jigar offline a little while ago, but the nuclear industry, the natural gas industry, while perhaps has been a little sleepy, there are incredibly skilled and incredibly thoughtful and incredibly seasoned people in this country who understand how to build natural gas and they understand how to build nuclear. There aren't enough, but they are there. And none of these people thought that Fermi had what it took other than a lot of hype.

So I mean, I think the people in the know on this space or the people who I respect in this space were not surprised by this. In fact, I think they were all sort of being like me, which is a little too cute right now.

Subject Really interesting from a letter filed by Toby in a Proxy Re: Re: Re: Team

"Toby is endorsing John Sellers, Co-CEO of Double Eagle Energy III, as Chairman and CEO immediately. John's business partner, Cody Campbell, was critical to ousting Toby, which means that this is a big deal..."

As painful as it is for me to say, as an act of compromise, that means **John Sellers, Co-CEO of Double Eagle Energy III** — or a leader who matches his qualifications and relationships — **should be made Chairman and CEO immediately**. Let me be clear: John's business partner, Cody Campbell, was critical to my ouster. And what makes this recommendation so hard is not what Cody did to me, but that he went too far with his tactics in doing it, coming at me and the Company hard on multiple occasions which culminated in his leading Texas Tech to demand my resignation. But I can hold a man accountable for his methods and still recognize that he, his business partner, and company are best suited to finish the job. **I am not going to let my pride come ahead of shareholder value**. That is how serious I think the situation is at Fermi, and how much I care about the company, its shareholders, and the people of the Panhandle of Texas. The solution allows Campbell to focus on being the lead fiduciary in his role as Chairman of the Texas Tech University System Board of Regents, while allowing Sellers to be the lead fiduciary of Fermi.
