Where the profit opportunity is

Move the research focus from completed reverse splits to financing events with measurable selling pressure and affordable execution.

My assessment: the materials justify further testing of this business. They do not demonstrate a scalable, production-ready short strategy or $20,000 of monthly net income. The best next experiment combines financing terms, cash need and actual share issuance, then ranks opportunities by expected net dollars at feasible size.

Decision	Reason
Prioritize financing catalysts	Recent financing is associated with much worse subsequent stock returns in the supplied dataset. Security terms offer more specific hypotheses than a split alone.
Expand discovery to deficiency notices	An earlier warning may provide more liquid entry opportunities. Separate equity/capital stress from routine governance or filing deficiencies.
Solve cover liquidity before scaling	The current patient model assumes completion for 39.85% of covered shares. This can dominate the apparent profit.
Optimize net dollars, not decline forecasts	A large expected decline in an unborrowable, untradeable stock is not revenue. Capacity, timing, carry and tail loss belong in sizing.

Immediate work: audit 100 financing/deficiency episodes into a point-in-time event ledger, replay a small set of frozen rules under identical execution assumptions, and collect prospective execution evidence. Retain the $25,000 and $50,000 targets as ceilings; allow smaller completed positions when those have the best economics.

This report audits supplied documents, recomputes their two microcap datasets and reconciles the findings with existing research artifacts. No new trading strategy was backtested, no orders were placed and no positive profit uplift is claimed as measured.

Reading guide: evidence and corrections pp. 2-13; prioritized tests pp. 14-21; business economics and validation from p. 22; appendices contain reading notes and the full source ledger. PDF bookmarks jump to each section.

What was audited

A large research catalog is useful, but its size overstates the amount of independently verified evidence.

Material	Audit result
External bibliography	187 entries: 98 resolve to supplied local assets; 89 are marked not downloaded. Their catalog summaries are not verified full-text findings.
Archives	134 extracted files, 129 distinct contents; 67 PDFs, 65 distinct PDF contents; 3,487 PDF pages. HTML/text copies and duplicated SEC PDFs are not independent evidence.
Academic / regulatory PDFs	54 files in the academic folder. Identity/opening-section screening; targeted methods, tables or conclusion checks for the most relevant sources. Many are working-paper versions.
Microcap datasets	All 1,183 reverse-split rows and 4,720 deficiency rows independently recomputed. CSV field definitions and study methodology checked.
Internal-resource inventory	890 rows: 73 curated, 561 filename matches, 256 filtered Drive hits. Only 56 curated rows are labeled high or medium relevance. This is a discovery inventory.
Internal implementation	Inspected local research artifacts, event/import contracts, process documents, dashboard compiler and borrow archive. External Box/Drive/private locations not supplied are inventory-only.

How to read the evidence

Recomputed means arithmetic reproduced from supplied data, not independently verified exchange prices. **Document checked** means the relevant supplied passage was reviewed, not all pages and appendices. **Hypothesis** means a proposed test rather than an established mechanism or a profit forecast.

The scanned Loughran-Ritter paper was checked visually at PDF pages 1, 2 and 24. The Chanos Enron file is an entire 211-page hearing; the relevant prepared testimony begins at PDF page 80. The appendices distinguish available documents from unavailable catalog claims. Attached-document instructions were treated as source material, not authorization to change trading rules, buy data or deploy.

Corrections that change the interpretation

The pack contains useful ideas, but several headline claims need repair before they enter a model.

Claim or shortcut	Correction and implication
PIPE Dreams attributed to Hillion / Vermaelen	The supplied May 2004 title page names Brophy, Ouimet and Sialm. It is related to their later PIPE research; do not count both as independent replications. [E133; PDF pp. 1-2]
ATMs were 63% of the market	ATM incidence was 63% OF SEO incidence in 2016; proceeds were 26% OF SEO proceeds. Program capacity is not actual issuance. [E031; PDF pp. 1-2, 5-6]
Median reverse-split return -72% across 1,183 events	The -72.24% median uses 760 observed 250-session returns. It starts at the pre-split close and excludes 164 early-stopped and 259 immature paths at that horizon.
Financing after the split identifies the best entries	A financing flag from the NEXT 60 days is a future outcome. It cannot be used to enter at the split. The prior-60-day flag is a candidate for timestamp validation.
Deficiency medians are direct short profits	Raw stock return, benchmark-relative return and short P&L; are different. Repeated notices, cover failures and borrow costs also matter.
Institutional cost evidence only says costs kill alpha	Frazzini-Israel-Moskowitz reports lower measured costs and greater capacity than prior estimates. This supports testing better execution, without calibrating our microcaps. [E103; PDF p. 1]

Additional corrections: 34.6% repeat splits uses all 1,183 events, including immature histories; the mature two-year cohort is 239/621 = 38.5%. A 2020/2022 bibliography year does not make an earlier supplied draft the final publication. Source provenance and version belong in every research claim.

What our existing results actually establish

There is a weak conditional business case at small fills, and a large unresolved liability in the exit assumptions.

Latest patient model: $50k target, one-hour entry, base, 5% recorded flow	Result
Period / events entered	2023-01-03 to 2026-10-13 / 547 of 551 events
Mean / median position actually modeled	$4,439 / $856
Annualized conditional trading profit	$21,133 (total $79,790)
Daily-closing drawdown / worst trade	$19,706 / -$17,017
Win rate / full $50k targets	39.7% / 25
Assumed cover completion	242 trades; 39.85% of cover shares beyond modeled volume
Additional 20% on those residual cover prices	$118,326 extra cost; annualized result about -$10,206

The reported $21,133 annual figure deducts sampled execution costs, assumed impact and modeled fees. It does not establish historical locates, locate fees, actual broker fills, operating expenses or taxes. It assumes same-day completion, with residuals priced at the last observed ask plus 2%. A failed cover must instead remain an open liability. [R1]

Longer entry windows increased size but lost edge. At a $25k target and base 5% flow, 30 minutes modeled $2,458 average size and $11,383 annual profit; four hours modeled $5,398 and only $300. Simply waiting for enough volume did not solve the revenue problem. [R1]

The earlier fundamental/Calmar studies are separate daily-bar models with different sizing, horizons and cost proxies. Their small positive filters are exploratory and fail some cost stresses. They cannot be added to the patient model as independent income streams. [R2-R4]

Reverse-split data: reproduce the headline

The drift is substantial. Its sample construction and return clock prevent reading it as an executable short backtest.

Horizon	Observed n	Mean stock return	Median stock return	Largest stock gain
0 sessions	1183	-4.3%	-5.3%	276.4%
1 sessions	1181	-7.1%	-8.7%	663.6%
5 sessions	1180	-9.0%	-13.5%	524.6%
20 sessions	1143	-15.2%	-22.7%	1,103.2%
60 sessions	1048	-20.0%	-37.8%	2,464.3%
120 sessions	943	-27.9%	-54.4%	2,520.5%
250 sessions	760	-39.7%	-72.2%	1,906.3%

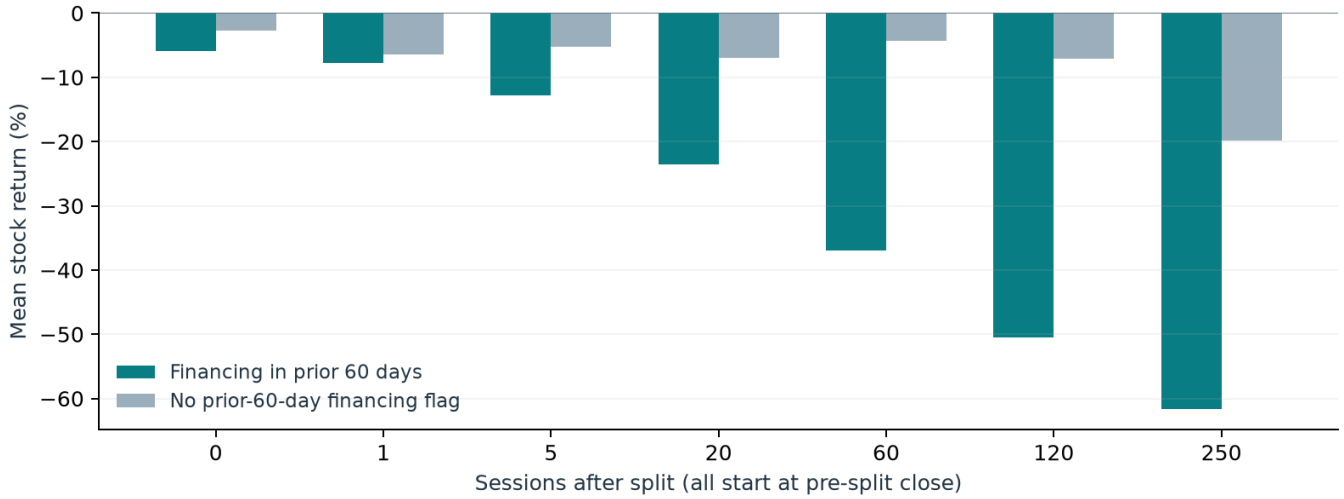

The source contains 1,183 split events across 734 issuers. Returns begin at the pre-split close and incorporate the split-day move. Our patient model enters after the next session opens. Those are different trades, different periods and different populations. A useful comparison must use the same issuer/date, entry timestamp, adjustment factors and exit rule. [E186] [E164]

At 250 sessions, 760 paths remain observed as trading; 164 stopped before that horizon and 259 had not yet reached it. The mean stock return is -39.70%, much less negative than the -72.24% median. The largest gain is +1,906.27%: a fixed-share short loss of roughly 19 times its original notional, before costs, if held throughout.

No zero-price cover is assigned to missing or delisted paths in this audit. The table is descriptive stock-price evidence. It is not a new trading simulation, capacity estimate, CAGR or forecast.

The most promising new split-data test

Prior financing is associated with worse returns. Test whether any of that difference survives a realistic event clock and costs.

Horizon	Prior financing: n / mean / median	No flag: n / mean / median
5	587 / -12.8% / -17.6%	593 / -5.2% / -9.5%
20	563 / -23.6% / -33.1%	580 / -7.0% / -14.3%
60	506 / -36.9% / -50.7%	542 / -4.3% / -24.3%
250	360 / -61.7% / -84.8%	400 / -19.9% / -60.9%

What is new here: these prior-financing cohort statistics were independently calculated during this audit. At 20 sessions the mean stock return is -23.57% versus -7.00%; at 250 it is -61.71% versus -19.89%. These are non-matched descriptive differences, not causal effects or forecast short returns.

What could invalidate the opportunity: late or misclassified filings, financing already priced in, more severe underlying distress, different liquidity and borrow, repeated issuer events, missing terminal paths, or an announcement gap that occurs before any feasible short entry. A prior-60-day financing flag alone does not distinguish an ATM authorization from an actual discounted deal.

Use the financing document as the event, reconstruct first public availability and compare matched issuers under identical execution and borrowing. Do not filter split-day entries using financing_60d_after, later delisting or next_reverse_split_2y. [E186]

Deficiency notices: a larger discovery pool

There are earlier signals to test, but thousands of notices do not mean thousands of independent trades.

Recomputed item	Result
Rows / issuers	4,720 / 1,255
Exchanges	4,471 Nasdaq; 249 NYSE American
New issuer/type episodes under supplied 365-day rule	2,722
Observed 250-session raw returns	3,996; mean -25.40%, median -60.17%
Episode-only 250-session raw returns	2,314; mean -23.81%, median -60.26%
Benchmark-relative median (all observed rows)	-65.07%; distinct from the raw stock return
Largest 250-session stock gain	+2,849.55%; 16 observed gains exceed +1,000%

Stockholders-equity and market-value deficiencies deserve a separate test from governance and late-filing notices. The raw 250-session medians are -69.18% for equity, -65.72% for market value of listed securities and -62.72% for bid-price notices. Category mix, repeat issuers and time periods can explain part of the difference. [E187]

The study excludes 117 notices with no post-notice trading; it uses carried or final prices in some off-exchange paths rather than observed broker settlement. Its event baseline is linked to the filing window. Rebuild the actual first-public timestamp so a decline before publication cannot become strategy profit. Foreign private issuers using 6-K are outside the described domestic 8-K collection.

Production discovery should record all notices, appeals, compliance updates and superseding notices as one issuer timeline. Only the first eligible, known episode can open a trade; a later split does not create a second independent bet while the first remains open. [E165]

What financing research supports

The terms of the capital matter more than a broad label such as "issued shares."

Evidence	Useful implication	Limit
Hillion-Vermaelen: floating-price convertibles	Test variable conversion, reset rights and effective share supply.	Old sample; negative stock performance is not external short profit. Selection into rescue financing matters.
Brophy-Ouimet-Sialm: structured PIPEs and investor composition	Separate fixed-price strategic capital from repricing structures and last-resort financing.	Investor identity alone is not the mechanism; early/final drafts are related evidence.
Park: distress x issuance	Combine funding stress with measured issuance rather than either signal alone.	Working paper; monthly cross-sectional analysis does not calibrate our event horizon.
Loughran-Ritter: long-run issuance drift	Use issuance as a research prior.	Five-year stock-return comparisons are not two- to twenty-session executable payoffs.
Billett-Floros-Garfinkel: ATM anatomy	Track authorization, actual drawdowns and cash uses separately.	Program announcements are not daily sale observations; financing can improve runway.
Lim-Schwert-Weisbach: PIPE economics	Reconcile discounts, warrants, cash and investor protections.	Returns to financing participants cannot be copied by an outside common-stock short.

A practical feature is **new economically saleable supply / expected accessible dollar volume**, conditional on cash need, discount and conversion terms. It is a hypothesis about price pressure and entry capacity. It should be compared with simple cash-runway, issuance and liquidity baselines rather than added as another unvalidated score.

Sources: [E026; PDF pp. 2, 9]; [E029; PDF pp. 1-2]; [E134; PDF p. 1]; [E001; PDF pp. 1, 24, visual]; [E031; PDF pp. 1-6]; [E030; PDF p. 2]

Borrow and informed-short evidence

The best-looking gross shorts often have the least reliable or most expensive inventory.

Drechsler-Drechsler finds predictability in expensive-to-short stocks even net of fees, while interpreting a shorting premium as compensation for concentrated risk. Beneish-Lee-Nichols finds lendable supply most constrained where signals are most attractive. Engelberg-Reed-Ringgenberg shows dynamic fee and recall risk can worsen when price moves against the short. None supports a constant borrow fee or guaranteed cover. [E097; PDF p. 2] [E100; PDF p. 1] [E096; PDF pp. 1, 32-33]

Potential feature	Use in our research
Loan fee and available quantity changes	Distinguish changing demand from shrinking supply; model the joint price/fee/recall path.
Short interest and days-to-cover	Use publication-lagged positioning and crowding context, not a locate or guaranteed return predictor.
Public filing or negative news	Test after-publication interpretation speed. Do not assume we can anticipate undisclosed news.
Cheap inventory in less extreme firms	Test whether lower gross edge yields more executable net dollars and a better risk-adjusted business.

There is counterevidence to simple rules: Asquith-Pathak-Ritter finds short-interest results sensitive to weighting and period; Kaplan-Moskowitz-Sensoy experimentally lowers lending fees without finding corresponding price effects. Association between high fees and poor future returns does not establish that short sellers caused the decline.

Selected checks: [E082; PDF p. 2]; [E087; opening abstract]; [E088; PDF p. 2]; [E089; opening abstract]; [E108; PDF p. 2]; [E093; PDF pp. 1, 31]

Distress, accounting and lottery stocks

Use these papers to specify mechanisms and competing explanations, not to manufacture a large composite score.

Research family	What it adds	Practical test
Distress and failure prediction	Cash, profitability, leverage, price and volatility jointly describe fragile equity.	Does cash need improve financing-event net P&L; beyond the existing deterioration score?
Accounting quality	Accruals, receivables, capitalization and reserves can identify unreliable earnings.	Use dated changes and primary filing evidence; compare incremental benefit after costs and review effort.
Lottery demand / maximum daily returns	Extreme upside characteristics may coexist with low subsequent average stock returns.	Test as both an alpha interaction and a squeeze/capacity penalty. A lottery stock can be a disastrous short path.
OTC / delisting	Observed quoted returns can conceal illiquidity and missing terminal prices.	Carry unresolved liabilities; require actual cover or settlement evidence before calling the result realized.
Replication / benchmark choice	Microcaps, weighting and multiple tests materially affect anomalies.	Issuer-separated walk-forward analysis, liquidity buckets and dollar-weighted implementable portfolios.

Beneish is a screening model for investigation, not a finding of fraud. Cash-runway estimates must separate restricted cash, actual operating burn, financing proceeds and debt obligations. A debt-funded acquisition, warrant exercise or share-count change can have several economic explanations. Missing data is not evidence of zero cash or zero liabilities.

Fama-French also finds little evidence that unprofitable firms, as a broad group, have unusually low returns. That is a useful challenge to a generic "bad company" short screen. The financing terms and timing need to add something beyond operating losses. [E011; opening abstract]

Sources: [E041; PDF p. 2]; [E056; PDF p. 2]; [E070; opening abstract]; [E072; opening abstract]; [E053; PDF p. 2]; [E024; PDF p. 2, supplied 2017 draft]

How to use the letters and practitioner pack

Extract source-checkable features. Keep the author's trade, allegations and hindsight separate from our evidence.

Material checked	Useful research contribution	Audit limitation
Chanos Enron testimony / value-trap slides	Reconcile earnings to cash, low economic returns, related parties and changes in the thesis.	Prepared testimony is inside a full hearing. Selected successes provide no strategy denominator.
Kerrisdale Camber report	Map convertible preferred premiums, resets, ownership blockers and share-count reconciliation.	The author explicitly estimates complex terms. Recalculate from original contracts and amendments.
Fuzzy Panda / Fugazi / other activist reports	Potential related-party, promotion, cash and capital-structure fields; contrary-evidence checklist.	Interested-party allegations and selected examples. No verified net return or hit-rate dataset is supplied.
DilutionTracker / Dilutracker explainers	Distinguish actual O/S, potential issuance, ATM capacity and alternate cashless mechanics.	Capacity bars are possible supply, not observed sales. Bank tiers are not causal proof of an impending decline.
SEC historical enforcement releases	Find financing structures and original legal documents for study.	An allegation, settlement or old court posture is not a current universal rule or a price forecast.
Horizon Kinetics / ETF path-dependence	Useful for a separate instrument-specific business question.	Daily-reset funds and ETNs are different liabilities; do not pool them with operating-company shorts.

Cap-table lesson: a 4.99% or 9.99% beneficial-ownership blocker can limit holdings at one instant without limiting total issuance over time as shares are sold and more are converted. Equally, registration, exercisability, shareholder approval, exchange caps, price floors and actual contract amendments can constrain supply. Model the exact instrument and date. [E147; PDF pp. 4-8]

Other targeted sources: [E140; PDF pp. 80-82]; [E179]; [E181]. No report allegation was adopted as an established fact about a currently listed issuer in this audit.

Execution assumptions: correct both directions

A less pessimistic spread and a more realistic cover model can move the answer in opposite directions.

Assumption	Assessment	Next test
Legacy 2.44% spread + 0.67% depth	These were ROUND-TRIP proxies. The $500 depth study does not support $25k-$50k orders.	Reconcile quotes and actual size without duplicating spread charges.
Multi-venue 1.72% median spread proxy	Potentially better price reference; still not verified NBBO. Median-to-median differences are not the paired savings.	Matched event/time comparison; paired improvement was about 0.275 percentage points.
$25k static book capacity	Both-side completion in 276/671 events (41.1%); conditional median spread plus depth about 5.95%.	Snapshot capacity is a diagnostic, not intraday capacity or a fill guarantee.
5% of recorded exchange flow	Incomplete venue coverage can understate volume; available prints are not all accessible fills.	Add unique consolidated prints only when available; estimate accessible flow and opportunity cost.
SSR 50% capture / 10bp impact per side	Both are assumptions. Patient offers can miss declining stocks and fill disproportionately before rallies.	Current-NBBO compliance, queue-aware bounds and actual adverse-selection measurements.
Residual cover at last ask +2%	Largest structural optimism in the patient model; a surcharge does not create liquidity.	Keep shares open, accrue costs and report liquidation-time/gap distributions.

Use **three joint cost cases: bear, base and bull**. Each combines execution and borrow assumptions in one case. Base should use measured, matched name/liquidity evidence; bull tests better but plausible access and completion; bear couples expensive borrow, adverse prices and reduced liquidity. Re-estimate from observed fills and charges. Until those exist, label the cases sensitivities rather than typical executable costs at $25k-$50k.

Sources: existing execution audit and patient model [R1, R5-R7]. A prior claim that the legacy model charged 2.44% each way was incorrect: it was a round-trip proxy. The patient model already embeds sampled bid/ask prices, so reducing the legacy proxy does not improve those results.

What is already built, and what is missing

Extend the existing evidence pipeline; do not start another disconnected short-selling framework.

Area	Already present	Gap to close
Filing furnace	Source locators, fact changes, falsifiers, categories and dashboard ingestion contract.	No normalized financing-event historical panel established by this audit. No event files found at the expected per-name path in inspected checkouts.
Capital structure	NET_EDGE_V3 import contract for scenario probabilities, incremental shares and net proceeds on the same split basis.	Source-checked financing terms and actual deal/share issuance records for the research cohort.
Borrow	10 timestamped archive files, 45,929 rows, Oct 13-19 2026; latest file 4,611 names.	Indications only, not approvals; a few days cannot validate historical availability, fees or recalls.
Execution evidence	Quote/trade/fill schema with known-at timestamps, policy hashes and broker references.	Verified NBBO, observed fills, order failures and completed covers at relevant size.
Research engine	Many baseline, fundamental, Calmar, realism and patient-entry studies; all variants retained.	Limited genuinely new validation after extensive historical searching.
Internal inventory	19/20 SSI location strings resolve directly; the remaining string includes a descriptive tab suffix.	Other repositories, Box/Drive sources and private notes are not verified contents merely because the inventory lists them.

The filing furnace, reverse-split process and framing-a-short playbook already require mechanisms, contrary evidence and tradability. The high-value implementation work is to populate and validate those contracts, then bind the event model to the execution model. [R8-R12]

Repository views are local snapshots, not a claim that remote main or every private vault has identical contents. The hub describes a private short-research area that was not present at the inspected local path. That is an availability gap, not proof no private research exists.

Rank the profit-improvement work

Prioritize changes that can increase executable net dollars. Track model repairs separately from alpha improvements.

Priority	Work	Profit mechanism	Evidence today
P0	Measure cover completion and correct liabilities	Prevents false profits and sets a credible capacity ceiling.	Direct failure in current replay; may REDUCE reported profit.
P1	Financing terms x cash need	Earlier, more specific catalysts; avoid generic low-edge split entries.	Strongest new descriptive lead plus relevant literature; net result untested.
P1	Net-dollar sizing with entry AND cover capacity	Allocate scarce inventory and execution effort where marginal dollars pay.	Existing infrastructure; cost curves need calibration.
P2	Deficiency episode expansion	More earlier opportunities with potentially better liquidity.	Large source dataset; PIT, borrow and costed replay missing.
P2	Cost-aware holding and exit	Capture continuing deterioration only while it exceeds carry and risk.	Gross drift; net multi-session performance unresolved.
P3	Accounting / crowding overlays	Improve selection or avoid dangerous paths.	Research prior; existing simple scores were fragile.
Later	Activist publication / ETF / options strategies	Different potential business lines.	Different instruments, data and economics. Keep separate.

Do not book projected revenue from any row until an implementable replay and forward evidence support it. Removing every conservative gate is not a profit improvement: it can increase turnover, paper P&L; and unpriced cover obligations simultaneously.

Priority is my judgment from this audit, not a fitted optimization or measured uplift. Work can proceed with cached data and public documents under the existing $0 new paid-download limit. Useful-size fill verification remains an external evidence dependency.

Build the event ledger once

Every financing record needs an economic state, a first-public time and an auditable source.

Field group	Required contents
Identity / clock	CIK, security and ticker aliases; original publication and SEC acceptance time; ingestion time separately; accession, exhibit locator and content hash.
Economic event state	Registration capacity; agreement signed; deal priced; closing; actual drawdown disclosed; conversion/exercise; reset/amendment; approval; termination. One deal ID, many dated states.
Shares and cash	Pre/post split basis; reported shares and as-of dates; common/pre-funded warrants; conversion principal, premium and reset floor; cash received, fees and debt extinguished.
Saleability	Registration effectiveness, lockups, exercisability, shareholder/exchange caps, ownership blocker, authorized headroom and dated amendment overrides.
Funding pressure	Unrestricted cash, burn, covenant/maturity obligations, stated use of proceeds; runway before AND after cash proceeds.
Market access	Prior liquidity/spread, time-of-day volume, SSR status, indicative/approved borrow size, fee, freshness and source.
Outcome / accounting	Entry attempts, fills, open shares, corporate actions, carry, price marks, recalls, covers, settlement and unresolved outcomes. Future labels stored apart.

Start with a 100-episode verification panel across deal types, liquidity buckets, SSR status and positive/negative paths. Use it to find extraction errors, not to select a winning rule. Review all complex variable-price or alternate-cashless instruments against their original exhibits. Double-review a random 20% plus every material disagreement.

Date-only sources become usable conservatively at the next eligible session unless an earlier public timestamp is established. A filing accepted after entry cannot provide entry features. The reverse-split CSV contains 136 split-related 8-K filing dates after the effective date; earlier notices may exist and must be located, not guessed. [R9-R10; supplied split CSV]

Test 1: financing pressure

Does the combination of cash need and economically saleable share supply improve net dollars?

Frozen comparison

Use newly public, priced or newly effective financing events in U.S.-listed operating companies. Keep cancelled and failed deals in the discovery denominator. Compare four nested rules: financing-only; financing plus cash pressure; financing plus quantified saleable supply; and both together. Use simple predeclared buckets, not dozens of tuned score thresholds.

Design element	Protocol
Start the clock	First verifiable public release of the material terms, followed by a fixed operational delay. Include the announcement gap as missed opportunity, not profit.
Primary economic features	Actual/committed incremental shares relative to current O/S and accessible volume; discount; reset rights; cash runway after proceeds; actual issuance history.
Controls	Same dates, size, price, liquidity, sector, prior returns and funding stress; distinguish ordinary fixed-price financing from variable/reset structures.
Sizing / execution	$25k and $50k ceilings, common feasible-fill model, identical risk constraints and cost cases. Retain zero/partial fills and failed covers.
Holds	2, 5, 10 and 20 sessions as declared endpoints; report every endpoint. Choose any final policy inside training only.
Pass condition	Positive net dollars versus simpler baselines after full costs; survives issuer clustering, later periods and executable-cost stress; no unresolved liability converted into a closed win.

Avoid a mechanical "more shares means the same percentage price drop" forecast. If existing equity is worth $20m across 10m shares, issuing 5m shares for $5m cash changes the simple value/share from $2 to $25m/15m = $1.67, before other effects. Issuing the same shares for $10m gives $2. Terms, proceeds and valuation all matter.

The 100-episode audit sample does not establish statistical power. Estimate required future observations from clustered variance and the smallest commercially useful net-dollar effect before freezing validation.

Test 2: listing stress before the split

Can earlier discovery provide more usable opportunities than waiting for a completed reverse split?

Build an issuer-level state timeline beginning with the first public deficiency disclosure. Separate bid-price, equity, market-value and reporting/governance categories. Record extensions, appeals, compliance and split plans only when known. Never enter at the private exchange-notice date unless it was already public.

Compare	What it answers
Deficiency only vs deficiency + cash pressure	Is the event itself predictive, or is the useful information a funding crisis?
Deficiency + actual financing vs financing only	Does listing stress add information beyond the financing?
Early notice vs later split announcement vs effective split	Does earlier entry improve net dollars after extra carry and a longer squeeze window?
Equity/market-value vs bid-price vs other deficiencies	Which mechanism has an economic case rather than a filing-label correlation?
First episode vs repeat issuer event	Does an apparent trade count simply recycle the same company and risk?

Rule versions are features, not constants

The current Nasdaq rulebook contains special treatment for recent reverse splits and cumulative split ratios, with procedural details and amendments. Historical events must use the rule effective on that date. A single print below $1 is not a completed deficiency process, and delisting is not a guaranteed zero-price cover. [W1]

The rulebook also links a July 29, 2026 stay concerning a newly approved $5m market-value requirement. This illustrates why an old law-firm summary or even an unqualified reading of displayed rule text is insufficient. Resolve effective/stayed provisions before using them in event timing. [W2]

Main source: supplied deficiency study/data. Current legal references checked on the audit date: Nasdaq 5800 series and its linked SEC stay letter. This is a research-data requirement, not a legal determination about any issuer.

Test 3: size by marginal net profit

A smaller short with a higher expected net edge can be a better business trade.

Forecast a distribution of gross price outcomes from training data and current public features. Estimate cost curves for both entry and cover, loan availability, carry, commissions and adverse selection. Then choose the size that produces the highest useful expected net dollars within the shared-account risk limits.

Research objective: expected net dollars(q) = q x expected gross dollars/share - entry cost(q) - cover cost(q) - carry(q) - commissions/fees(q) - other expected trading liabilities. Apply separate loss, margin, liquidity and concentration constraints; use an uncertainty haircut rather than treating a point forecast as certain.

Illustrative size	Gross edge	Total cost	Net dollars
$10,000	5.0% = $500	1.0% = $100	$400
$25,000	5.0% = $1,250	2.5% = $625	$625
$50,000	5.0% = $2,500	4.5% = $2,250	$250

In this invented example, $25k is better than $50k. The last $25k adds $1,250 gross but $1,625 cost, reducing net profit by $375. A name with lower gross edge can win if it has cheaper borrow, tighter spreads and reliable covers. These percentages are illustrative, not estimates from our fills.

Compare with simple policies

Test fixed $25k/$50k targets, liquidity-only caps and the existing adaptive forecast approach under identical data and dates. Use training-only forecasts with shrinkage toward the baseline. Report net dollars, failed fills and tail loss by forecast decile; do not select sizes using that trade's realized return.

A fixed 0.5% forecast buffer is not validated. Replace it only through a frozen comparison with cost uncertainty and a minimum expected dollar contribution. Preserve outcomes of rejected trades to measure opportunity cost and forecast error.

Patient entry: improve the opportunity, measure the cost

Optimize total implementation shortfall, including the price move missed while waiting.

Step	Research implementation
Set the economic deadline	Entry budget and time limit depend on remaining forecast edge and catalyst timing. Do not wait all day merely to reach a target.
Work child orders	Passive or appropriately marketable limits; child size tied to recent accessible flow and observed liquidity. Keep a cover-capacity reserve.
Respect price restrictions	Use current verified national best bid for restricted short orders. A sampled venue bid and a blanket capture ratio are research bounds.
Update remaining edge	A falling stock can exhaust the opportunity before the order completes. Missed decline is an opportunity cost, not evidence our own trading caused impact.
Measure selection	Compare fills with all attempted orders. Passive fills followed by rallies can erase apparent spread savings.
Estimate own impact	Compare small observed child fills with contemporaneous controls, quote movements and later markouts; separate market drift from our participation.

Keep the initial experiment narrow: the current one-hour schedule as the benchmark, a short early schedule and an adaptive deadline with a frozen remaining-edge rule. Participation is a sensitivity until measured; include commissions and minimums at child-order level. Record cancels, rejects, missed opportunities, rebates and venue routing.

Better multi-venue coverage may reveal additional capacity, but an off-exchange print is not automatically accessible to our order. Do not multiply all fills by an assumed 30-50% missing-volume uplift. SEC Rule 201 reference [W3]. Cost-aware institutional evidence supports investigation, not transplanting large-cap cost coefficients. [E103]

Cover first: the binding capacity test

Every share sold creates a liability that survives an unsuccessful cover attempt.

Maintain an event-driven share ledger. After each modeled cover interval, reduce the liability only by shares supported by the declared execution evidence. At the close, any remainder stays open, with an explicit mark, overnight gap exposure, loan fees, recall risk and the next eligible cover opportunity. A price penalty is a stress scenario; it is not a fill.

Required output	Why it matters
Completion by deadline, in shares and dollars	A 95% trade-count success rate can hide most of the size in the failed 5%.
Time to full liquidation	Business turnover, funding and risk depend on when cash and obligations are actually released.
Residual liability by issuer and date	Prevents missing-price or halted paths from disappearing from equity and drawdown.
Ordinary, squeezed and halted exit paths	The expensive tail occurs when liquidity and prices change together.
Same-day versus overnight-required cohorts	Separates a flat intraday business from a carry-intensive short portfolio.
Profit excluding unsupported completion	Show proven realized cash flow separately from marked open obligations; retain both in account equity.

Test how to improve completion

Compare an earlier cover start, progressive covers during liquid intervals and a predeclared remaining-shares deadline. The economic trade-off is less captured decline versus lower forced-cover cost. Test these against the same entries before increasing the entry participation rate.

Paper fills and quote replay cannot establish queue priority or actual broker access. A prospective observational stage can validate timestamps and model bounds. Any live execution calibration is a later, separately authorized trading decision; this audit places no orders.

Holding periods, stops and profit-taking

Longer drift is valuable only if it exceeds the extra carry, execution cost and risk of waiting.

Planned hold	Illustrative calendar days	Borrow 50%	Borrow 150%	Borrow 500%
2 sessions	3	0.43%	1.27%	4.25%
5 sessions	7	0.99%	2.98%	9.92%
10 sessions	14	1.98%	5.95%	19.83%
20 sessions	28	3.97%	11.90%	39.67%

These are hypothetical constant-price borrow costs as a percentage of initial notional, using 102% collateral without dollar rounding. Calendar days are examples, not a settlement calendar. Actual modeled cost must use settled obligations, weekends/holidays, fee changes, collateral rounding and daily marks. At a $0.50 stock price, rounding the collateral mark to $1 can make the collateral 200% of stock notional. [W4]

Primary test: identical entries with 2-, 5-, 10- and 20-session time exits and a complete liability ledger. Decompose overnight and intraday returns. Report incremental net dollars per additional day, not just terminal gross return. A falling stock can improve the short while its volume and borrow deteriorate.

Stops: keep a survivable size and a predeclared emergency cover instruction. A stop is not a maximum-loss guarantee through gaps or halts. Use thesis falsification, recall, operational deadlines and shared-account risk limits. Treat the already studied 20% stop/20% target as a comparator, not as a validated production bracket.

Profit-taking: test progressive cover when remaining expected edge falls below remaining costs and risk. Do not adopt a round-number target from the best historical cell. Novy-Marx-Velikov supports avoiding unnecessary turnover; Lou-Polk-Skouras shows timing components can differ by anomaly, not that our overnight short is profitable. [E104; PDF p. 2] [E078; PDF p. 3]

The business arithmetic

$20,000 a month requires both net edge and substantially more completed notional than we have demonstrated.

Annual trading contribution = completed opportunities/year x average filled notional x average net return on that notional. Business profit then subtracts operating expenses and other business costs. Use dollar-weighted results and the full distribution; median stock declines do not belong in this formula.

Average completed short	Net per trade	Dollars/trade	Trades/year for $240k
$25,000	1.0%	$250	960
$25,000	2.0%	$500	480
$25,000	4.0%	$1,000	240
$50,000	1.0%	$500	480
$50,000	2.0%	$1,000	240
$50,000	4.0%	$2,000	120

At 146 opportunities per year, $240k needs about $1,644 net per opportunity: 6.58% on a fully filled $25k or 3.29% on $50k. If only 75% of opportunities obtain a completed trade, those requirements rise to roughly 8.77% and 4.38%. This is requirement arithmetic, not an expected return.

At the current modeled $4,439 mean fill, $240k at 146 completed trades would require about 37% net per trade. That illustrates why the present small-fill result cannot be extrapolated into the business target. Deficiency and financing expansion could increase the denominator, but overlap and access must be measured first.

Existing patient-model annualization is about 145 entries/year, not an independent forecast of future event flow. The table uses a rounded 146 for comparability with the prior business discussion. Any fixed overhead increases the required gross trading contribution dollar for dollar.

How much an improvement would be worth

Use these sensitivities to rank research effort. They are arithmetic targets, not forecasts of available alpha or fills.

At 146 fully completed $25k positions, annual traded entry notional would be $3.65m. A cost saving of 10 basis points across that notional is $3,650; 50bp is $18,250; one percentage point is $36,500. The same saving is worth less when partial fills reduce completed notional.

Potential improvement	Illustrative annual contribution	What has to be proved
Save 0.5 percentage points in costs	$18,250 on $3.65m completed notional	Matched actual prices and completed covers; no duplicate spread savings.
Add 100 independent $25k trades at 2% net	$50,000	New event flow, locates and fills after removing overlapping issuer episodes.
Add 100 independent $50k trades at 2% net	$100,000	Both-side capacity at $50k and stable net edge at that size.
Improve net edge by one percentage point	$36,500 on $3.65m completed notional	Later-period, costed signal improvement rather than historical selection.
Avoid one $25k short that rises 200%	$50,000 avoided price loss	An ex-ante risk rule that does not sacrifice more expected profit elsewhere.

These benefits cannot be summed mechanically. An earlier financing entry may increase gross edge but require more carry; filtering squeezes may remove profitable trades; a tighter cost target may reduce fills. Evaluate each change in one common portfolio replay and show its incremental net contribution.

The current $50k-target, one-hour model actually averages only about $643k of entry notional per year. A 50bp improvement on that scale is roughly $3,200. Better spreads alone are therefore unlikely to bridge the gap to $240k annual profit; more independent feasible trades and better net edge must do most of the work. [R1]

All figures are before fixed business overhead. The $643k figure is modeled entered notional, not proof that all shares can be covered at the assumed prices. Lowering a cost assumption without execution evidence produces no verified dollar saving.

Cost, interest and capital efficiency

Cheaper financing and fewer low-value orders can improve the business, but proceeds interest will not rescue a weak microcap trade.

Use two separate ledgers: trading cash flow and funding/margin. Borrow fee, proceeds interest, commissions, dividends or payments in lieu, corporate-action cash flows and locate charges must each have their own sign and source. Avoid subtracting spread twice when fills already use bid/ask prices.

Short proceeds interest

Assumption carried forward: IBKR Pro, $10m hypothetical portfolio and existing USD shorts above $100k. Credit this sleeve with the incremental tiered interest, I(existing + sleeve) - I(existing), using eligible settled balances. Do not apply another $100k zero-interest threshold to the sleeve. Published USD Pro tiers checked for this audit range from 2.630% above $100k to 3.630% above $3m; these are current rates, not a historical fee series. [W5]

For scale only: $25k credited at 2.630% for seven calendar days earns about $12.78 before settlement/balance adjustments. Use account statements to determine the actual incremental credit. Overnight hard-to-borrow fees can be much larger, and a conditional same-day-flat model cannot claim a material overnight credit.

Commissions and capital

At an illustrative $0.005/share each way, a $25k short at $1 incurs $250 round-trip commission, or 1%, before other fees; at $5 it is $50, or 0.2%. Child-order minimums can make small fills worse. Apply the actual account schedule and dated regulatory charges rather than a universal percentage.

Collateral is not the same as incremental house margin or deployable cash. A +200% move loses $50k on an original $25k short and $100k on $50k, before costs; loss can exceed those shocks. Reprice every open name and house requirement jointly with Michael's existing positions. Measure net dollars per stressed margin dollar and per analyst/execution hour.

Official cost and statement sources [W4-W5]. Exact account margin and fee schedules were not accessed. Historical results must use historical rates; current public indications do not backfill them.

Validation that can support a profit claim

Separate discovery, model selection and genuinely new outcomes.

Layer	Required discipline
Data repair	Reconcile events, split factors, share basis, first-public time and terminal paths before estimating alpha. Keep original and repaired versions.
Exploratory development	Label all previously inspected history as development. Use a small hypothesis registry and retain negative results.
Chronological evaluation	Training-only forecasts and parameters; later test periods with no refitting. Embargo overlapping holding windows.
Issuer dependence	Issuer-clustered uncertainty and issuer-disjoint robustness tests; do not split repeated deals from one issuer randomly across train/test.
Multiple choices	Account for financing groups, four horizons, size policies and exit variants. Publish all registered comparisons, not just the best Calmar.
Portfolio replay	Common borrow, cash, margin, risk, liquidity and concurrency constraints; open liabilities remain marked. Event-level statistics are supplementary.
Forward evidence	Freeze a candidate version before the next events. Log every discovery, rejection, locate, quote, attempt, fill, failure and close.

Keep the designated sealed holdout untouched until its existing protocol authorizes evaluation. This audit did not read it. New prospective observations are especially valuable because many earlier strategy settings were selected after studying historical data.

A 10-20-event execution study can reveal bad fill assumptions; it cannot establish annual expected return, rare-squeeze probability or maximum drawdown. A 30-trade operational checkpoint is not statistical proof either. Estimate evidence requirements from issuer-clustered variance and commercial effect size; report wide uncertainty when the sample is small.

Replication counterevidence: the supplied Hou-Xue-Zhang 2017 draft reports much weaker anomaly evidence after reducing microcap influence and raising significance thresholds. This motivates robustness checks; it does not prove every microcap signal is false. [E024; PDF p. 2]

The dashboard should answer five questions

Keep the top-level business view simple, with the audit detail one level below.

Question	Primary display
Did we actually make money?	Net realized P&L;, marked open liabilities, all trading costs, operating-expense allowance and monthly distribution. Separate modeled and observed results.
How much can we trade?	Discoveries -> eligible -> borrowable -> attempted -> entered -> fully covered; filled dollars and failure reasons at each step.
Which opportunities pay?	Financing type, listing state, liquidity and fee cohorts; net dollars, cost share, mean/median, win rate, profit factor and concentration.
What can go wrong?	Dollar drawdown, daily and intraday adverse marks, expected shortfall, worst issuer/day, squeeze and recall stresses, residual cover exposure.
Is the business scalable?	Net dollars vs target size, completed notional, participation, cover time, peak/stressed house margin, collateral and labor/data costs.

CAGR, Sharpe, Sortino and Calmar require a declared funded-capital denominator and a complete daily marked-equity series. Present $10m portfolio-overlay returns separately from return on allocated business capital. A large denominator can make percentage drawdown look tiny while the strategy loses many months of its own expected profit.

Monte Carlo after model repair

Resample calendar/issuer blocks with overlapping events and preserve price, liquidity, borrow and recall dependence. Include parameter uncertainty, regime shocks and unobserved-tail stresses. Enforce the same margin and execution constraints in every path. Report distributions of annual net dollars, losing months, drawdown, capital need and failure to liquidate.

Do not independently shuffle only completed winning/losing trades or force covers in every path. Monte Carlo propagates assumptions; it does not validate them or manufacture evidence for $20k/month.

A practical sequence of work

Advance through evidence gates. The week labels are planning ranges, not promised completion dates.

Stage	Work and output	Suggested responsibility	Gate
1 / weeks 1-2	Correct catalog; verify 100 episodes; join identity, filing clock and capitalization states; reconcile the two source datasets.	Research engineer + capital-structure analyst	Material terms and timestamps reproducible; disagreements resolved.
2 / weeks 2-4	Repair residual cover accounting; add settled carry, fees, credit and price/liquidity stresses; benchmark entry schedules.	Execution / data engineer	No unsupported share disappears; exposure and cash reconcile.
3 / weeks 4-6	Run financing-pressure and deficiency comparisons at $25k/$50k ceilings and four time exits; publish all outcomes.	Quant researcher + analyst review	Economically useful improvement survives later periods and full-cost stress.
4 / weeks 6-8	Compare marginal-net sizing, progressive covers and simple risk rules within training; freeze one candidate.	Quant + risk owner	Size adds net dollars without hidden liquidity or margin failure.
5 / subsequent events	Prospective discovery and execution calibration; include every failure; review sample sufficiency.	Execution owner + risk owner	Observed completion/costs match declared bounds; sufficient independent outcomes.

Parallel data and research work can shorten elapsed time, but a corrected event ledger and cover model are dependencies for credible alpha tests. No automation, capital allocation, order routing or live deployment is authorized by this schedule.

Suggested roles are responsibilities, not assignments to named people. Current work can use public filings and cached data at $0 new paid-download cost. If licensed consolidated history is unavailable within existing access, label the replay as bounded research rather than silently substituting venue bars for NBBO.

Pass, pause or retire each hypothesis

A profit plan needs explicit reasons to stop spending time as well as reasons to continue.

Question	Advance when	Pause / reject when
Financing pressure	It adds net dollars beyond distress-only and liquidity-only rules in later periods.	The gap occurs before entry, disappears after costs or depends on future financing labels.
Deficiency expansion	It adds independent completed opportunities after removing overlaps and lag errors.	More notices merely recycle issuers or require uneconomic longer borrow.
Patient sizing	Larger size adds positive marginal net dollars with observed/bounded covers.	More size raises paper revenue only because costs stay fixed or residuals are forced closed.
Longer holds	Additional expected decline exceeds additional carry, liquidation risk and capital use.	Median gross returns improve while mean net dollars or tails deteriorate.
Production candidate	Positive net contribution, credible cost calibration, survivable shared-account risk and sufficient forward evidence.	Unresolved liabilities, missing approvals, unstable results or concentration dominate the business case.

A useful strategy need not hit $20k/month immediately. A smaller business with repeatable completed trades and measured costs can justify gradual development. The commercial target should be evaluated as a probability distribution of annual and monthly net dollars, not as a smooth monthly promise.

Recommended decision now: fund the research effort first in financing-event reconstruction and cover-cost validation. Do not increase modeled size by relaxing assumptions until the incremental shares have a defensible cover path. Expand to listing stress after establishing the common event and execution ledger.

The report is an audit and research plan. It leaves existing adopted strategy rules and risk thresholds unchanged. New research comparisons must be versioned and distinguished from production approval.

Unresolved questions and evidence needed

These gaps affect the answer materially; the current pack cannot resolve them.

Unknown	Evidence needed
Actual $25k-$50k entry and cover costs	Observed orders/fills or a high-quality full replay with queue/impact bounds, matched on name, time and size.
Financing-type historical opportunity count	Complete priced/cancelled/closed deal ledger including amendments, foreign forms and inactive issuers.
Borrow and recalls at entry and throughout holding	Dated approvals and account charge/return records; public indications only as explicitly limited sensitivities.
Tradable terminal outcomes	OTC access, corporate-action processing, buy-ins, cash-in-lieu and actual position resolution.
Cap-table extraction reliability	Original exhibits and amendments with reconciled claims, cash proceeds and split basis; blind manual checks.
Incremental account margin and interest	Account-specific tiered balances, house rules and joint-portfolio stress, supplied as files rather than protected Gateway access.
True business net profit	Data/licensing, research and execution labor, software, financing, compliance and other overhead. Tax shown separately.

The bibliography leaves 89 full texts unavailable. Retrieve only sources that address a specific remaining decision and are available legally within the existing access/budget. More papers are lower priority than a verified event clock and completed cover evidence.

No paid market-data download was made. No ThetaData or IB Gateway access was used. This audit read existing local aggregate research and the supplied files, not the designated sealed holdout. No repository strategy changes or deployment were made.

Appendix A / reading notes

What each supplied academic or regulatory PDF contributes to the research design.

These are concise screening notes, not claims of full-page-by-page replication. Specific page locators identify targeted checks. The bibliography ledger that follows supplies the original catalog identity and URL; original metadata errors are flagged rather than silently rewritten.

E074 / The Cross-Section of Volatility and Expected Returns

Volatility exposure. Idiosyncratic-volatility return evidence is a research prior, not a rule to short every volatile stock. Use volatility both as a control and a squeeze/impact feature; factor-model and weighting choices matter.

Supplied file: ang_hodrick_xing_zhang_2006_idiovol.pdf; 57 PDF pages. SHA-256 1edc3dfbfce8ecb6...

E063 / Asset Pricing in the Dark: The Cross-Section of OTC Stocks

OTC implementation. OTC prices and cross-sectional returns are affected by severe trading frictions. Use for missing-price and terminal-liability design, not as evidence that an exchange-delisted short can be covered at its last quote.

Supplied file: ang_shtauber_tetlock_2013_otc.pdf; 77 PDF pages. SHA-256 70870ffe2f7beca7...

E082 / Short interest, institutional ownership, and stock returns

Counterevidence. Short-interest results differ by period and equal/value weighting. This is an important check against broad short-interest signals; use lagged disclosures and executable dollar-weighted portfolios. Opening abstract checked.

Supplied file: asquith_pathak_ritter_2005.pdf; 47 PDF pages. SHA-256 92aac2b30abb317b...

E047 / Anomalies and financial distress

Distress interaction. Pricing-anomaly evidence interacts with financial distress and credit conditions. Test whether distress enriches a financing signal or merely concentrates illiquid risk. Broader anomaly results are not our event calibration.

Supplied file: avramov_chordia_jostova_philipov_2013.pdf; 56 PDF pages. SHA-256 ad5d951a4e957882...

E070 / Maxing Out: Stocks as Lotteries and the Cross-Section of Expected Returns

Lottery / tails. Large recent daily gains are associated with poor subsequent stock returns in the studied setting. For a short, that same upside tendency creates path risk. Test alpha and risk effects jointly, after costs.

Supplied file: bali_cakici_whitelaw_2011_max.pdf; 50 PDF pages. SHA-256 8039f72214b13107...

E072 / Stocks as Lotteries: The Implications of Probability Weighting for Security Prices

Theory. A model of investor preferences for skewness motivates lottery-like overpricing. It supplies a competing mechanism, not an estimated microcap short return, borrow rate or holding period.

Supplied file: barberis_huang_2008_lotteries.pdf; 50 PDF pages. SHA-256 a01b374f400ac89b...

E056 / The Detection of Earnings Manipulation

Accounting screen. Supplied June 1999 draft describes a manipulation-detection screen and explicitly requires further investigation. Model flags are not fraud conclusions. Use dated accounting changes and an incremental net-profit test. PDF pp. 1-2 checked.

Supplied file: beneish_1999_mscore.pdf; 27 PDF pages. SHA-256 78b2f0143770c9c0...

E100 / In short supply: Short-sellers and stock returns

Inventory constraint. Supplied October 2014 draft finds lending supply central when short constraints bind and shares least available in attractive shorts. Use access and fee paths jointly with alpha; do not treat an attractive score as inventory. PDF p. 1 checked.

Supplied file: beneish_lee_nichols_2015_short_supply.pdf; 55 PDF pages. SHA-256 b3b4a0a7e3229e5b...

E031 / At-the-Market Offerings

Direct financing design. Journal version distinguishes ATM programs and actual drawdowns. Correct the 63%-of-SEO denominator. Capacity and cash stockpiling are not observed immediate share sales. PDF pp. 1-6 and drawdown discussion checked.

Supplied file: billett_floros_garfinkel_2019_atm.pdf; 21 PDF pages. SHA-256 5829493304cd3cab...

E083 / Which Shorts Are Informed?

Informed flow. Order-level NYSE short activity contains information in the studied sample, with transaction-cost discussion. Public FINRA short volume is not the same proprietary signal. Opening section and PDF p. 32 cost discussion checked.

Supplied file: boehmer_jones_zhang_2008.pdf; 48 PDF pages. SHA-256 8f89228dc56f5dab...

E107 / Efficiency and the Bear: Short Sales and Markets around the World

Market quality. Cross-country short-sale-constraint evidence concerns price efficiency and market structure. Use as background on constraints, not a directly deployable U.S. microcap alpha model or proof shorting causes declines.

E029 / Hedge Funds as Investors of Last Resort?

Direct financing design. Published PIPE study distinguishes security structure and investor composition; 5,244 transactions, 1995-2002. Repricing rights and last-resort selection motivate event features. Investor returns/access differ from an outside short. PDF pp. 1-2 checked.

Supplied file: brophy_ouimet_sialm_2009.pdf; 34 PDF pages. SHA-256 83c040367cea14fa...

E066 / The Twilight Zone: OTC Regulatory Regimes and Market Quality

OTC regimes. Supplied NBER paper studies OTC regulatory regimes and market quality. Dates in the draft and publication metadata differ. Use reporting/trading regime transitions in terminal-price analysis; do not assume quoted OTC prices imply liquidity.

Supplied file: bruggemann_kaul_leuz_werner_2018.pdf; 100 PDF pages. SHA-256 de8c8a6600d17a72...

E128 / Zombie Lending and Depressed Restructuring in Japan

Background / limited transfer. Japanese zombie-lending evidence concerns bank support and economic distortions. It motivates financing dependence but is not a calibrated U.S. equity short signal, and continued financing can delay rather than accelerate failure.

Supplied file: caballero_hoshi_kashyap_2008_zombie.pdf; 72 PDF pages. SHA-256 c9ca524e4dd10926...

E041 / In Search of Distress Risk

Failure prediction. Supplied NBER 2006 draft combines financial and market variables in failure risk and examines low distressed-stock returns. Useful baseline controls; not a net short backtest in our universe. PDF p. 2 and concluding discussion checked.

Supplied file: campbell_hilscher_szilagyi_2008.pdf; 54 PDF pages. SHA-256 abeebdee0a1190a2...

E087 / Supply and Demand Shifts in the Shorting Market

Loan supply vs demand. Proprietary lending data separates short-demand from supply shifts. A negative return relation after increased demand motivates changes, not a static high-fee cutoff. Our public inventory indications cannot recreate the study. Opening abstract checked.

Supplied file: cohen_diether_malloy_2007.pdf; 49 PDF pages. SHA-256 5d7bdfc14b05269e...

E075 / Death and Jackpot: Why Do Individual Investors Hold Overpriced Stocks?

Distress / lottery. Failure risk and jackpot characteristics offer an explanation for low average returns with occasional huge gains. Use as a joint downside-edge/upside-tail hypothesis; avoid forecasting from the median alone.

Supplied file: conrad_kapadia_xing_2014_death_jackpot.pdf; 64 PDF pages. SHA-256 3a0256d3fc0a94ed...

E010 / Market Reactions to Tangible and Intangible Information

Issuance measurement. Tangible/intangible information and issuance-related return evidence motivate careful controls. Split-adjusted share growth must separate financing from acquisitions, compensation and corporate actions. Long-run associations are not event-time fills.

Supplied file: daniel_titman_2006.pdf; 58 PDF pages. SHA-256 158d1d63266f7897...

E093 / The Market for Borrowing Stock

Loan-market mechanics. Institutional intermediary data from April 2000-September 2001 covers fees, supply and recalls. Average availability does not describe our extremes. Recall can remove profitable shorts and create forced-cover costs. PDF pp. 1 and 31 checked.

Supplied file: davolio_2002_borrowing.pdf; 36 PDF pages. SHA-256 3c3112b52a4e60f5...

E084 / An Investigation of the Informational Role of Short Interest in the Nasdaq Market

Positioning. High short interest in Nasdaq stocks is informative in the studied period. Treat as publication-lagged context, with size and period controls. Reported short interest does not establish current lendable supply or our ability to fill.

Supplied file: desai_et_al_2002_nasdaq_si.pdf; 25 PDF pages. SHA-256 d4154230867e10f2...

E097 / The Shorting Premium and Asset Pricing Anomalies

Risk compensation. The July 2014 NBER draft reports fee-linked predictability gross and net, and a risk-based shorting-premium interpretation. It supports testing, not ignoring concentrated short risk. PDF p. 2 and liquidity-matching discussion checked.

Supplied file: drechsler_drechsler_2014_shorting_premium.pdf; 56 PDF pages. SHA-256 3429596a8844fa0f...

E089 / How are shorts informed? Short sellers, news, and information processing

Public-information processing. Short sellers appear especially informed around public news, rather than clearly anticipating it. Test post-publication filing interpretation and execution delay. Do not assume access before the announcement. Opening abstract checked.

Supplied file: engelberg_reed_ringgenberg_2012_informed.pdf; 53 PDF pages. SHA-256 4c739de06dc60148...

E096 / Short-Selling Risk

Dynamic borrow risk. Forthcoming draft studies fee/recall uncertainty and risk-return effects; fees and supply can worsen during extreme returns. Constant-fee replays miss this dependence. PDF pp. 1, 32-33 checked.

Supplied file: engelberg_reed_ringgenberg_2018_risk.pdf; 48 PDF pages. SHA-256 9a983bb43d9b507c...

E011 / Dissecting Anomalies

Replication / counterevidence. Net issuance, accrual and momentum findings are stronger than some growth/profitability effects; unprofitable firms do not broadly have unusually low returns. Challenge generic bad-company screens. Require implementable weighting. Opening abstract checked.

Supplied file: fama_french_2008_dissecting.pdf; 35 PDF pages. SHA-256 43e61c015cabdb17...

E103 / Trading Costs of Asset Pricing Anomalies

Execution counterevidence. Institutional actual-cost evidence is more encouraging than the pack summary implies: lower costs and greater capacity than earlier estimates. Supports testing cost-aware execution; not a microcap coefficient. Abstract and introduction checked.

Supplied file: frazzini_israel_moskowitz_2012_costs.pdf; 67 PDF pages. SHA-256 55a750abfd2a4659...

E124 / SPACs

Separate structure. SPAC sponsor/investor economics and post-merger outcomes motivate dilution and redemption features. Separate SPAC securities, warrants and de-SPAC common shares; do not combine their returns or instrument liabilities.

Supplied file: gahng_ritter_zhang_2023_spacs.pdf; 49 PDF pages. SHA-256 9236fd8509325e1d...

E094 / Stocks are special too: an analysis of the equity lending market

Borrow and anomalies. The economics of specials and short-sale frictions constrain implementation of anomalies. Historical institutional borrowing conditions do not establish our inventory. Evaluate total carry and displacement risk against remaining edge.

Supplied file: geczy_musto_reed_2002_special.pdf; 46 PDF pages. SHA-256 f0ff40732eca4d47...

E044 / Book-to-Market Equity, Distress Risk, and Stock Returns

Distress / valuation. Distress risk interacts with book-to-market returns. Use as a competing explanation and matched-control design. A cheap distressed equity can retain recovery optionality and can rally sharply after financing.

Supplied file: griffin_lemmon_2002.pdf; 20 PDF pages. SHA-256 96fe1eac64425327...

E026 / Death spiral convertibles

Direct financing design. Floating-price convertibles produce negative stock-performance evidence, with adverse selection and weak operating firms discussed. Distinguish the security mechanism from selection. Old gross returns do not prove current net profitability. PDF pp. 2, 9 checked.

Supplied file: hillion_vermaelen_2004_death_spiral.pdf; 105 PDF pages. SHA-256 9aac8b25dbddcb74...

E133 / PIPE Dreams? - Brophy, Ouimet and Sialm (May 2004 draft)

Metadata error / related draft. Actually Brophy, Ouimet and Sialm, May 2004, not Hillion-Vermaelen. Structured vs traditional PIPEs; related to later Brophy work. Correct attribution and research lineage before counting evidence. PDF pp. 1-2 checked.

Supplied file: hillion_vermaelen_2004_pipe_dreams.pdf; 45 PDF pages. SHA-256 9add0b87e9c0ab99...

E013 / A Financing-Based Misvaluation Factor and the Cross Section of Expected Returns

Issuance factor. Issuance/repurchase-related return evidence provides a broader benchmark. Use actual point-in-time net issuance and cash economics. Do not let market-wide issuance factors substitute for the specific deal and execution clock.

Supplied file: hirshleifer_jiang_2010_umo.pdf; 60 PDF pages. SHA-256 75f6dbd5b9514efe...

E088 / Days to Cover and Stock Returns

Positioning and liquidity. DTC combines short ratio and turnover and is more informative in the study than short ratio alone. It also signals difficult liquidation. Use lagged inputs and separate alpha from capacity. Opening abstract checked.

Supplied file: hong_et_al_2016_days_to_cover.pdf; 51 PDF pages. SHA-256 72eb8e65319fbc52...

E024 / Replicating Anomalies

Multiple-testing control. Supplied NBER 2017 draft, not assumed final 2020 tables. Anomaly significance weakens with reduced microcap influence and stricter hurdles. Requires robust weighting, tests and all-result reporting. PDF p. 2 checked.

Supplied file: hou_xue_zhang_2020_replicating.pdf; 130 PDF pages. SHA-256 8d00169a4cf6b489...

E095 / Short-sale constraints and stock returns

Constraint / price relation. Historical short-sale constraints and overpricing inform the limits-to-arbitrage framework. The lending market and period differ greatly from current microcaps; no numeric cost or expected-return transfer is justified.

Supplied file: jones_lamont_2002_constraints.pdf; 55 PDF pages. SHA-256 e6eabff838b073ee...

E108 / The Effects of Stock Lending on Security Prices: An Experiment

Causal counterevidence. Randomized loan-supply experiment lowers fees without detected changes in returns, volatility, skewness or bid-ask spreads. Do not infer that short activity mechanically causes declines. PDF p. 2 checked.

Supplied file: kaplan_moskowitz_sensoy_2013.pdf; 58 PDF pages. SHA-256 77d110e75b4953fa...

E038 / Return Performance Surrounding Reverse Stock Splits: Can Investors Profit?

Direct split evidence. Study of 1,612 reverse splits in 1962-2001 finds long-run poor stock performance and explicitly emphasizes difficulty earning it by shorting. Supports a gross prior, not the business forecast. PDF pp. 1-2 and constraints discussion checked.

Supplied file: kim_klein_rosenfeld_2008.pdf; 20 PDF pages. SHA-256 3428afe28b4dabfe...

E123 / A Sober Look at SPACs

Capital-structure accounting. SPAC dilution analysis motivates a complete claim/cash reconciliation. Rights, redemptions, sponsor shares and warrants are not interchangeable. A financing participant may receive protections unavailable to an outside short.

Supplied file: klausner_ohlrogge_ruan_2022_spacs.pdf; 76 PDF pages. SHA-256 0b52e441158950de...

E113 / Go Down Fighting: Short Sellers vs. Firms

Issuer response. Issuer opposition to shorts and constrained-arbitrage evidence motivate operational and recall scenarios. Do not select only famous failures or assume an issuer response will quickly produce an executable decline.

Supplied file: lamont_2012_go_down_fighting.pdf; 49 PDF pages. SHA-256 0a646644fff3121c...

E067 / Who Falls Prey to the Wolf of Wall Street? Investor Participation in Market Manipulation

Promotion / market quality. Promotion and pump-and-dump-related evidence can inform attention and disclosure features. Publication or investigation labels require original evidence and known-at times. A promotional rally creates both potential overvaluation and dangerous short paths.

Supplied file: leuz_et_al_2017_wolf.pdf; 85 PDF pages. SHA-256 a2fe31276aa0d9e0...

E030 / The Economics of PIPEs

Financing economics. Supplied October 2017 NBER draft studies 3,001 PIPEs and investor protections. Cost to issuer and return to financing participant differ from common-share short payoff. Reconcile warrants, discounts and cash. PDF pp. 1-2 checked.

Supplied file: lim_schwert_weisbach_2021_pipes.pdf; 52 PDF pages. SHA-256 c624837deb2df66e...

E117 / How Constraining Are Limits to Arbitrage?

Activist-information channel. Evidence that credible public revelation can induce long holders to sell motivates source-checkable research. Publishing selected short theses is a different strategy with research and legal costs. NBER abstract checked.

Supplied file: ljungqvist_qian_2016.pdf; 52 PDF pages. SHA-256 f98cb551f6f3275a...

E078 / A Tug of War: Overnight Versus Intraday Expected Returns

Time decomposition. Supplied March 2015 draft finds overnight/intraday components differ across anomalies, sometimes offsetting. Decompose our own event returns before choosing holds. It is not evidence for universally holding microcap shorts overnight. PDF p. 3 checked.

Supplied file: lou_polk_skouras_2019_tug_of_war.pdf; 67 PDF pages. SHA-256 6cd0ad7cf0f062db...

E001 / The New Issues Puzzle

Issuance prior / scanned. Visual review of PDF pp. 1, 2, 24 confirms five-year underperformance for 1970-1990 issuers, including SEO compound returns around 7% vs 15% matched controls. This does not imply absolute negative stock returns or profitable shorting.

Supplied file: loughran_ritter_1995_new_issues_puzzle.pdf; 29 PDF pages. SHA-256 8b5f5fc7b444c4d2...

E098 / Is There a Risk Premium in the Stock Lending Market? Evidence from Equity Options

Borrow inference / version. Supplied September 2016 draft uses equity options to infer lending fees and expected returns. Not a verified final 2022 version. Sparse/no microcap option chains limit applicability. PDF p. 1 checked.

Supplied file: muravyev_pearson_pollet_2022.pdf; 42 PDF pages. SHA-256 7113ee50bb773431...

E109 / Short sales, institutional investors and the cross-section of stock returns

Ownership / constraints. Institutional ownership proxies constraints in anomaly research. Useful control; it is not current broker inventory or proof of a locate. Report lags and institutional portfolios can make contemporaneous inference misleading.

Supplied file: nagel_2005_short_sales.pdf; 46 PDF pages. SHA-256 add973511e657c08...

E104 / A Taxonomy of Anomalies and Their Trading Costs

Turnover mitigation. Buy/hold spreads and simple trading-cost mitigation can preserve anomalies, especially lower turnover. Test hysteresis and marginal cover decisions rather than constant re-entry. Supplied abstract PDF p. 2 checked.

Supplied file: novy_marx_velikov_2016_taxonomy.pdf; 61 PDF pages. SHA-256 694db41db44968d1...

E134 / Equity Issuance and Returns to Distressed Firms

High-priority interaction. August 2012 working paper links greater distress to more net issuance and concentrates low abnormal returns among heavy issuers. Motivates funding-pressure x issuance test; not a validated 5% share-growth threshold. PDF pp. 1-2 checked.

Supplied file: park_equity_issuance_distressed.pdf; 64 PDF pages. SHA-256 e7791eb1d7dc8a9f...

E055 / Value Investing: The Use of Historical Financial Statement Information to Separate Winners from Losers

Financial-state baseline. Financial statement signals separate outcomes in a value-oriented sample. A low score is not a standalone short or calibrated default probability. Compare against existing deterioration and simple cash-runway rules before adding complexity.

Supplied file: piotroski_2000_fscore.pdf; 42 PDF pages. SHA-256 670a994c641312fb...

E090 / Short interest and aggregate stock returns

Aggregate timing. Aggregate short interest and market return predictability concern a different level of aggregation. It can motivate a regime-control study, not a per-name locate, entry rule or immediate business scaling assumption.

Supplied file: rapach_ringgenberg_zhou_2016.pdf; 20 PDF pages. SHA-256 d9314e87b2580a38...

E116 / Short Sale Position and Transaction Reporting (Dodd-Frank 417 study)

Regulatory background. 149-page staff study on short-sale position/reporting information. Screened as market-structure background, not a trading experiment. Same contents appear again in practitioner archive; count once.

Supplied file: sec_2014_short_sale_reporting.pdf; 149 PDF pages. SHA-256 3c2f13ffa98f3d53...

E115 / Staff Report on Equity and Options Market Structure Conditions in Early 2021

Squeeze / structure. 45-page staff report supplies a squeeze-market case and distinctions among trading/short-interest concepts. Not an estimated microcap squeeze distribution or trading rule. Duplicate contents in practitioner pack.

Supplied file: sec_2021_gamestop_staff_report.pdf; 45 PDF pages. SHA-256 58405d94685361c2...

E053 / The Delisting Bias in CRSP Data

Terminal-return bias. Missing negative delisting returns can bias stock-return databases. For a short, a bad stock outcome still needs a valid cover/settlement and borrow path. Do not equate missing data to realized profit. PDF p. 2 checked.

Supplied file: shumway_1997_delisting_bias.pdf; 15 PDF pages. SHA-256 ec9f9e4b9815b57b...

E052 / Forecasting Bankruptcy More Accurately: A Simple Hazard Model

Failure baseline. Hazard-model bankruptcy prediction motivates time-varying risk and surviving observations. Build point-in-time features and avoid conditioning on eventual failure. Predicted bankruptcy is not an executable short payoff.

Supplied file: shumway_2001_hazard.pdf; 25 PDF pages. SHA-256 750d962764f9df7f...

E076 / The Short of It: Investor Sentiment and Anomalies

Short-leg concentration. Anomaly returns can concentrate on the short side and vary with sentiment. Test regime dependence and limits to arbitrage rather than extrapolating unconditional average returns or pooling correlated signals.

Supplied file: stambaugh_yu_yuan_2012_short_of_it.pdf; 32 PDF pages. SHA-256 63190639e014b9f9...

Appendix B / full external source ledger

All 187 bibliography rows, including the 89 full texts absent from the supplied archives.

Available = the listed local filename resolves to an extracted asset. This does not certify its catalog summary or imply full review. Absent = not provided locally; catalog-only. The row ID is used throughout the report. Titles link to the catalog URL. Companion HTML/text versions are not additional studies.

Appendix C / internal inventory audit

An index of resources is not proof that those resources are relevant, accessible or currently implemented.

Inventory segmentation	Rows
Curated entries	73
Automatic filename matches	561
Filtered Drive hits	256
Total	890

Curated relevance labels: 29 high, 27 medium, 14 low, 2 none and 1 unknown. Automated hits include generic activist letters, work files and keyword noise. Long activist managers are not automatically short sellers, and repeated transcript exports are not independent trading evidence.

The internal CSV contains links into Drive, Box, private GitHub and an original /workspace path structure. Those contents are not included merely because their locations appear in the CSV. The report does not claim to have read all 890 underlying files.

Resource	Observed state
SSI research and scripts	Code/docs available locally; process and import contracts checked.
Filing furnace events	Expected per-name event-file path not populated in inspected primary/managed checkouts.
Borrow history	Ten snapshots, Oct 13-19 2026; 45,929 total rows, all public indications.
Research-vault archive	Local vault present; filename inventory is a discovery source. No broad corpus-content audit claimed.
Private short-research path	Not present at inspected expected local vault path; remote/private existence unresolved.
Magis SHORT_OVERLAYS reference	Listed outside supplied archives; proposed thresholds are not treated as approved or calibrated.

The user request authorizes this audit and plan. It does not adopt an instruction embedded in INDEX.md, an internal resource description or a third-party letter.

Appendix D / local evidence and method

Exact input artifacts and internal references used to reproduce the audit.

ID	Reference	Relative path in inspected managed checkout

Managed checkout: C:\Users\drewg\.codex\worktrees\shorts-portfolio-sleeve\single-stock-investments

Audit workbench: C:\Users\drewg\Projects\dashboards\single-stock-investments_system\data\reverse_splits\local\literature_audit_2026-10-21

Reproduction: source_manifest.json records archive and extracted-file hashes; pdf_inventory.json records page counts and text locations; bibliography_audit.json maps all 187 catalog rows; dataset_audit.json and prior_financing_horizons.json record recomputed statistics. Original source CSVs remain in the extracted practitioner/microcapledger directory.

Return arithmetic: arithmetic means and medians use numeric raw stock-return fields; reverse-split horizon comparisons retain status=trading. No prices, locates or broker settlements were independently reconstructed from exchanges for this audit. No inferred short fill is inserted into the supplied datasets.

Appendix E / primary web references

Current rules and broker mechanics were checked against original sources, rather than relying only on old summaries.
