Description

With the 1-year anniversary of the crypto bear market nearly upon us, it's time to pay attention to crypto again. Crypto has historically traded in 4-year cycles, with the bear market usually lasting one year, which would put the potential end of the bear market in October.

Hyperliquid, the world's largest DEX (decentralized exchange) for perps (perpetual futures), is a highly asymmetric investment where investors benefit from increased trading activity on the exchange without having to pick winners.

The best expression of Hyperliquid in the stock market is being long PURR, the leading Hyperliquid DAT (digital asset treasury). PURR trades at around 1x NAV. In the likely upcoming multi-year bull market, investors can win from HYPE increasing in value and from PURRs' mNAV expanding, which enables the flywheel of accretive equity issuance to buy more HYPE.

A note on DATs

DATs proliferated in 2025 and experienced a rapid and severe boom/bust cycle, with the leading DATs down 85%+ from their highs last year. While DATs were easier to form last year, they are nearly impossible to form now – for example, Adam Back's \$4B bitcoin DAT was cancelled in August 2026.

Hyperliquid

Hyperliquid enables anyone, anywhere, to trade any asset without requiring any KYC. Simply connect a wallet to the exchange and trade.

Hyperliquid started 2025 with ~301k users and ~\$2 billion in open interest (OI). By the end of the year, it had grown to ~923k users and ~\$6 billion in OI. Over 2025, Hyperliquid generated ~\$873 million in profits and processed ~\$2.9 trillion in trading volume, making it the biggest derivatives DEX by far, and one of the fastest-growing financial apps ever. Crucially, 99% of that protocol revenue goes to buy back and effectively burn HYPE, making it also one of the strongest examples of value capture in crypto today.

At \$20B market cap, HYPE trades at 23x 2025 "earnings" (profits that flowed to token holders via token buybacks & burn). Earnings doubled in 2025.

Differentiation vs. Binance (\$100B market cap) and other crypto exchanges

Hyperliquid is a vertically-integrated L1 (layer 1) blockchain and DEX that was built specifically for high-speed trading. Its performance rivals centralized exchanges (CEX), while retaining the benefits of crypto ideals such as decentralization and self-custody – every trade, order, and liquidation happens 100% onchain, and users always keep custody of their assets.

Put simply, Hyperliquid has created a crypto exchange that behaves as fast and efficiently as Binance, while keeping the important parts transparent and controlled by the blockchain rather than by a private company.

The vertical integration is very important both as a source of differentiation and should enable HYPE to trade at a higher valuation multiple than other exchanges. Consider Uniswap (an application on Ethereum) on Ethereum (a leading L1). Uniswap is an application sitting on top of Ethereum. Ethereum wasn't specifically built just for Uniswap.

Ethereum has to support:

- NFTs
- lending
- games
- stablecoins
- prediction markets
- payments
- thousands of other applications

So Uniswap has to live within Ethereum's limitations.

Hyperliquid took a different approach. Instead of building an exchange on someone else's blockchain, Hyperliquid built the blockchain itself around the needs of an exchange. Hyperliquid built a blockchain specifically to operate a high-performance financial exchange.

That potentially lets it combine two things that historically were difficult to combine:

Centralized exchanges like Binance

- extremely fast
- excellent liquidity
- sophisticated order books

with

DeFi (decentralized finance)

- transparent
- onchain
- self-custodial
- rules enforced by code/consensus rather than a private exchange database.

Hyperliquid is the first DEX to combine the best attributes of centralized exchanges and decentralized finance, which makes Hyperliquid a credible challenger to Binance.

L1s (such as Ethereum) can also trade at extremely high valuation multiples in bull markets, which should enable HYPE to trade at a much higher valuation than other exchanges that don't have their own L1.

CEX vs. DEX

A growing number of traders prefer to trade on DEXs because of the ability to self-custody. The major exchange blowups in crypto have been from centralized exchanges such as FTX, Mt. GOX, Celsius.

Expansion beyond traditional crypto assets

Hyperliquid is beginning to emerge as a credible, 24/7 price discovery venue for event-driven synthetic markets, as evidenced by oil trading activity during the U.S.-Iran conflict, pre-IPO assets trading like Cerebras, SpaceX, and Unitree, and equities such as NVDA and MU.

Enabling anyone in the world to trade any asset permissionless is one of the largest and most lucrative opportunities in finance.

One example of the benefits of being able to trade any asset 24/7 was during the initial phases of the Iran conflict:

24/7 Oil Futures Hold Steady Above \$100

By [Vicky Ge Huang](#)

While traditional oil markets take a break over the weekend, digital platforms are providing a 24/7 preview of where crude prices are headed.

On the crypto exchange Hyperliquid, prices for contracts linked to the West Texas Intermediate crude traded at around \$102 a barrel as of 6:20 p.m. ET on Saturday, up about 5% over the previous 24 hours.

In traditional markets, the U.S. oil benchmark officially finished the week at \$98.71 a barrel on Friday and will resume trading at 6 p.m. ET on Sunday.

Since the U.S.-Israeli airstrikes in Iran began, overseas traders have [rushed to bet on oil prices on Hyperliquid](#) as fighting in the Middle East unfolded over the weekends. The cumulative volume on the exchange's oil futures surged to about \$7.3 billion on Thursday from \$339 million on Feb. 28, according to crypto data provider Kaiko.

Morgan Stanley trader looking at pre-IPO perps for the upcoming Cerebras IPO:

@tradexyz @HyperliquidX

9:47 PM · May 14, 2026 · 760.6K Views

During the SpaceX IPO, the pre-IPO perps and then live market became the second most traded asset on Hyperliquid, doing over \$1B of volume. There was also a 10x increase in new wallets created on Hyperliquid on the day of the SpaceX IPO.

As Hyperliquid continues to expand into different asset classes and as third-party developers continue to grow via HIP-3, Hyperliquid's revenue cyclicalty should somewhat improve and the TAM should increase by a lot.

Product expansion

Hyperliquid has a dominant position in perps and with HIP-4 announced earlier in 2026, has expanded into prediction markets and crypto options trading. Hyperliquid's platform enables cross-margining which is something the standalone platforms like Polymarket can't offer.

The TAM is significant: prediction markets are doing \$21B per month in volume and crypto options generate over \$180B per month during peak periods.

Network effects

Hyperliquid is trying to build a Binance-quality trading experience without requiring you to trust Binance. Hyperliquid has designed their

exchange to attract professional market makers, which increases liquidity, which then attracts more traders, which then attracts more liquidity in a positive feedback loop that creates a powerful moat for the exchange.

Becoming the Visa for crypto exchanges

Hyperliquid wants to become the invisible trading infrastructure underneath thousands of different crypto apps, allowing those apps to spend the money and effort acquiring customers while Hyperliquid keeps the valuable part — the shared liquidity and exchange infrastructure.

Hyperliquid uses builder codes and HIP-3 deployers, which enable third-party developers to build on top of the Hyperliquid infrastructure. Thousands of other apps, websites, and developers bring customers to Hyperliquid, while Hyperliquid itself keeps control of the actual trading engine and liquidity.

A centralized exchange like Coinbase or Binance generally has to acquire users itself through:

- advertising
- sponsorships
- affiliates
- referral programs
- its own app
- its own website
- geographic expansion
- sales/marketing teams

Hyperliquid has created a system where other people can build businesses on top of Hyperliquid and bring the customers for it.

This is attractive to developers because building an exchange from scratch is incredibly difficult. Developers can now focus on customer acquisition, customer experience, etc... while Hyperliquid handles much of the difficult exchange infrastructure.

Doing this at scale enables Hyperliquid to build a powerful network effect:

Diverse businesses such as retail trading apps, institutional terminals, Telegram bots, AI trading agents, Wallets, mobile apps, country-specific exchanges, social trading apps, prediction/speculation products, all build on top of Hyperliquid and bring users and trading volume. That trading volume attracts market makers which attracts liquidity and with better liquidity, more developers want to build on that platform.

This effort is already gaining traction with teams outside of Hyperliquid. For example, Trade [XYZ] is a large HIP-3 deployer and grew their OI from nothing to \$2.9B in six months – less than half of the top 30 markets on Trade[XYZ] are crypto markets – other markets include equities and commodities.
